Destination Earth

implemented by

Introduction to the project

Our collective goals :

To develop Co-Design Methods & Toolkit for DestinE to put the users at the center of service development
To develop an experimental supersite to help the city of Marseille to reach its objectives toward sustainability

Agenda

Presentations

I. Introduction to Co-design for the DestinE platform

Why co-design is required in the specific context of the Destination Earth Platform, Introduction to the toolkit and methods, Lessons learned during the co-design with the City of Marseille, Video testimonies from stakeholders involved in co-design activities with the city of Marseille

II. Introduction to the interactive part of the workshop

Introduction to the tools to be used , Explanation of the two exercises

Workshop session

Phase 1 – Diagnosis of co-design needs

1. Active work by participants (10min) :

Participants will be asked to carry out their own co-design diagnosis using the data-information-value journey (as a part of the co-design toolkit). Co-design facilitators will help them in using this framework and identifying the structure of their ecosystem both upstream and downstream, as well as their position within it.

Feedback and discussion (10min)

Phase 2 – Structuring co-design sessions

1. Active work by participants (10min)

Based on the diagnosis, participants will be asked to identify the main co-design issues they have to manage and to propose a structure for co-design sessions that would enable them to address these issues. Co-design facilitators will help them in drawing conclusions from the diagnosis and envisioning a proper structure for co-design sessions.

Feedback and discussion (10min)

I.

Introduction to Co-design for the DestinE platform

The co-design methodology

A brief history of co-design in innovation and design research

Co-design methods have a long history of development with academic research performed in design sciences, innovation and management sciences from 1970's.

For a decade, the Center on Management Science is at the forefront of the research on co-design with some critical contributions, including :

- The PhD Thesis of Louis-Etienne Dubois (2015)
- The PhD Thesis of Raphaëlle Barbier (2023) – e-shape

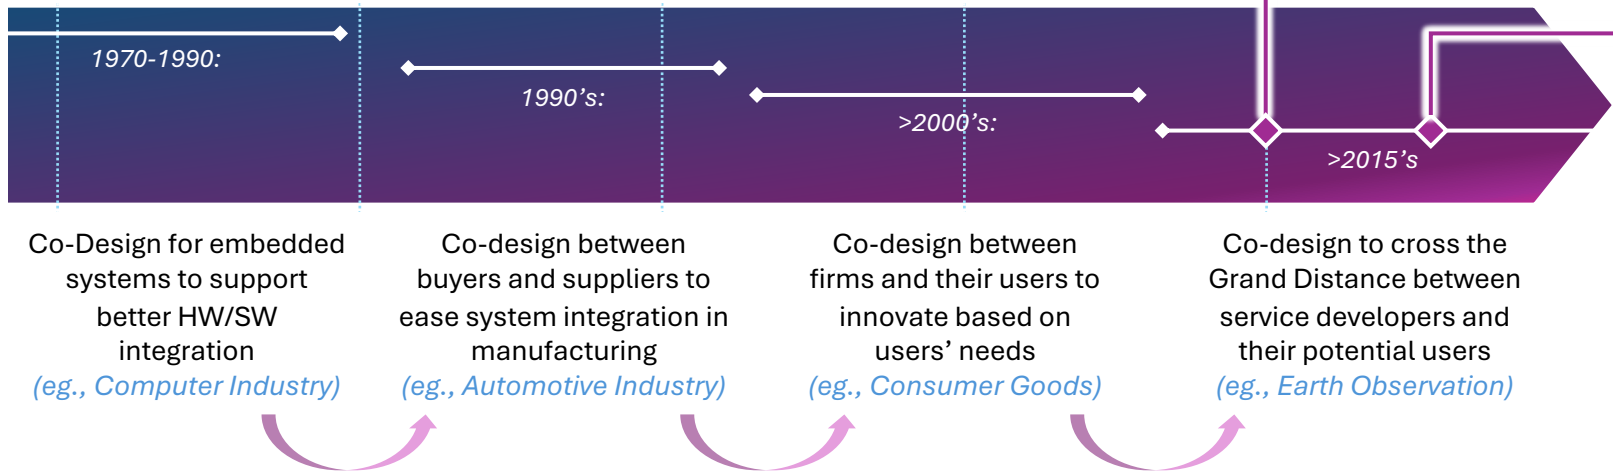

The critical contribution of e-shape (2019-2021)

- Unveiled the issues arose due to Grand Distance
- Proposed a co-design method for Earth Observation (Barbier, 2023) :
 1. *Diagnosis Phase*
 2. *Action Phase*
 3. *Outcomes Phase*
- Coined the 'resilient-fit' perspective, focused on 'the design of the co-'

Towards co-design for Destination Earth (>2024)

The specific context of the Destination Earth Platform raise new challenges :

- Managing the tension between contextualization and genericity
- Managing multilateral relationships between various stakeholders
- Ensuring that users develop the ongoing ability to use the platform's services autonomously

What is Co-Design ?

Overall, co-design can be defined as

« **A form of collaborative innovation that puts a specific emphasis on the need of (re)inventing the relationships between the involved actors.** » (Barbier, 2023)

It encompasses three critical aspects :

- **A design aspect:** the need to explore innovative solutions beyond existing services and starting from users' needs
- **A collective aspect:** The need to involve heterogeneous actors along the design journey
- **A crisis aspect:** The need of (re)inventing the relationships between the actors when there is no obvious way to interact

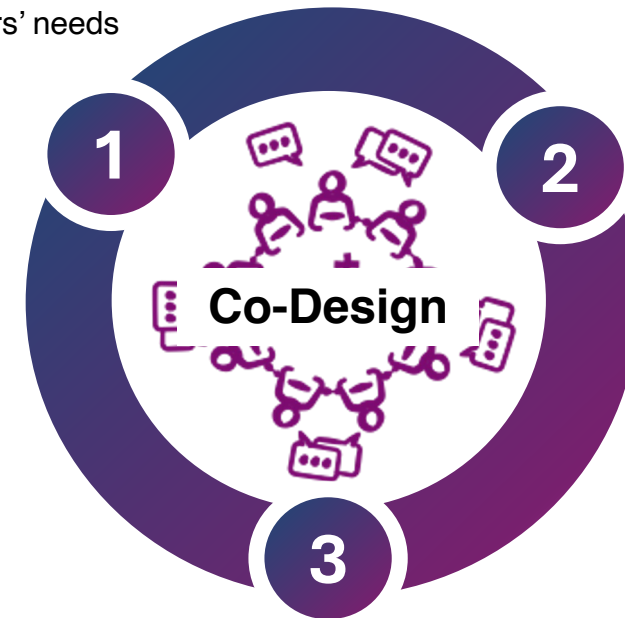

A design aspect

The exploration of innovative services starting from users' needs

A collective aspect

The involvement of heterogeneous actors in the design journey

A crisis aspect

The need of (re)inventing the relationships between the actors when there is no obvious way to interact

Why does co-design matter for Destination Earth ?

Co-Design methods stand as a consistent way to answer some of the key challenges faced by climate data based service developers.

1

Key challenges faced by services designers

Crossing the Grand Distance between Data experts and potential users

The potential users do not know how to use climate data and often do not even know that they could be useful for them.

How Co-Design can Help ?

Co-Design has proven efficient for crossing Grand Distance and putting users at center

The proposed co-design methods support a collective exploration by the service developers and their potential users that foster a mutual learning

2

Structuring multilateral relationships within a complex data ecosystem

Designing services based on climate data requires a complex chain of players with diverse skills and interests to be set in motion.

Co-Design allows to organize interactions as to build resilient relationships

The co-design methods rely on disentangling the various needs as to identify the right sequence of workshops within the chain of stakeholders

3

Fostering service reuse across various use-context

As an emergent platform, DestinE implies to manage the tension between context-specific solutions and generic reusable services

Co-Design allows to manage the tension between contextualization and genericity

Some co-design mechanisms can help to conciliate contextual answers to specific needs with the genericity required for service reuse across contexts

The typical co-design journey for Destination Earth

1 - THE USER APPROACH

The first step in the co-design process relies on identifying and getting in touch with promising potential users. Engaging them requires specific efforts, covered by the co-design methodology.

This phase is required to clarify the usage ecosystem, disentangle the various opportunities and select the more promising ones.

Step 1
User Approach

Step 2
Diagnosis

Step 3
Workshops

Step 4
Outcomes

2 - CO-DESIGN DIAGNOSIS

The Co-Design Diagnosis phase consists in assessing the status of the system both from a technical and an organizational perspective. The co-design workshops have to be organized based on this careful diagnosis.

This phase is critical to clearly delineate the various challenges to address through the co-design workshops.

3 - CO-DESIGN WORKSHOPS

Co-Design workshops are the very heart of co-design. The success of the overall co-design process depends on structuring the right sequence of workshops as well as on using the right protocols for each of them.

These workshops are essential when it comes to place the users' needs at the center and to feed strong, resilient relationships

4 - CO-DESIGN OUTCOMES

Co-design outcomes can be of varying natures. The final phase of co-design consists in agreeing on these outcomes and the next steps they could lead to.

A clear formulation of the outcomes is required to support resilient relationships between the stakeholders and to foster subsequent collaborations.

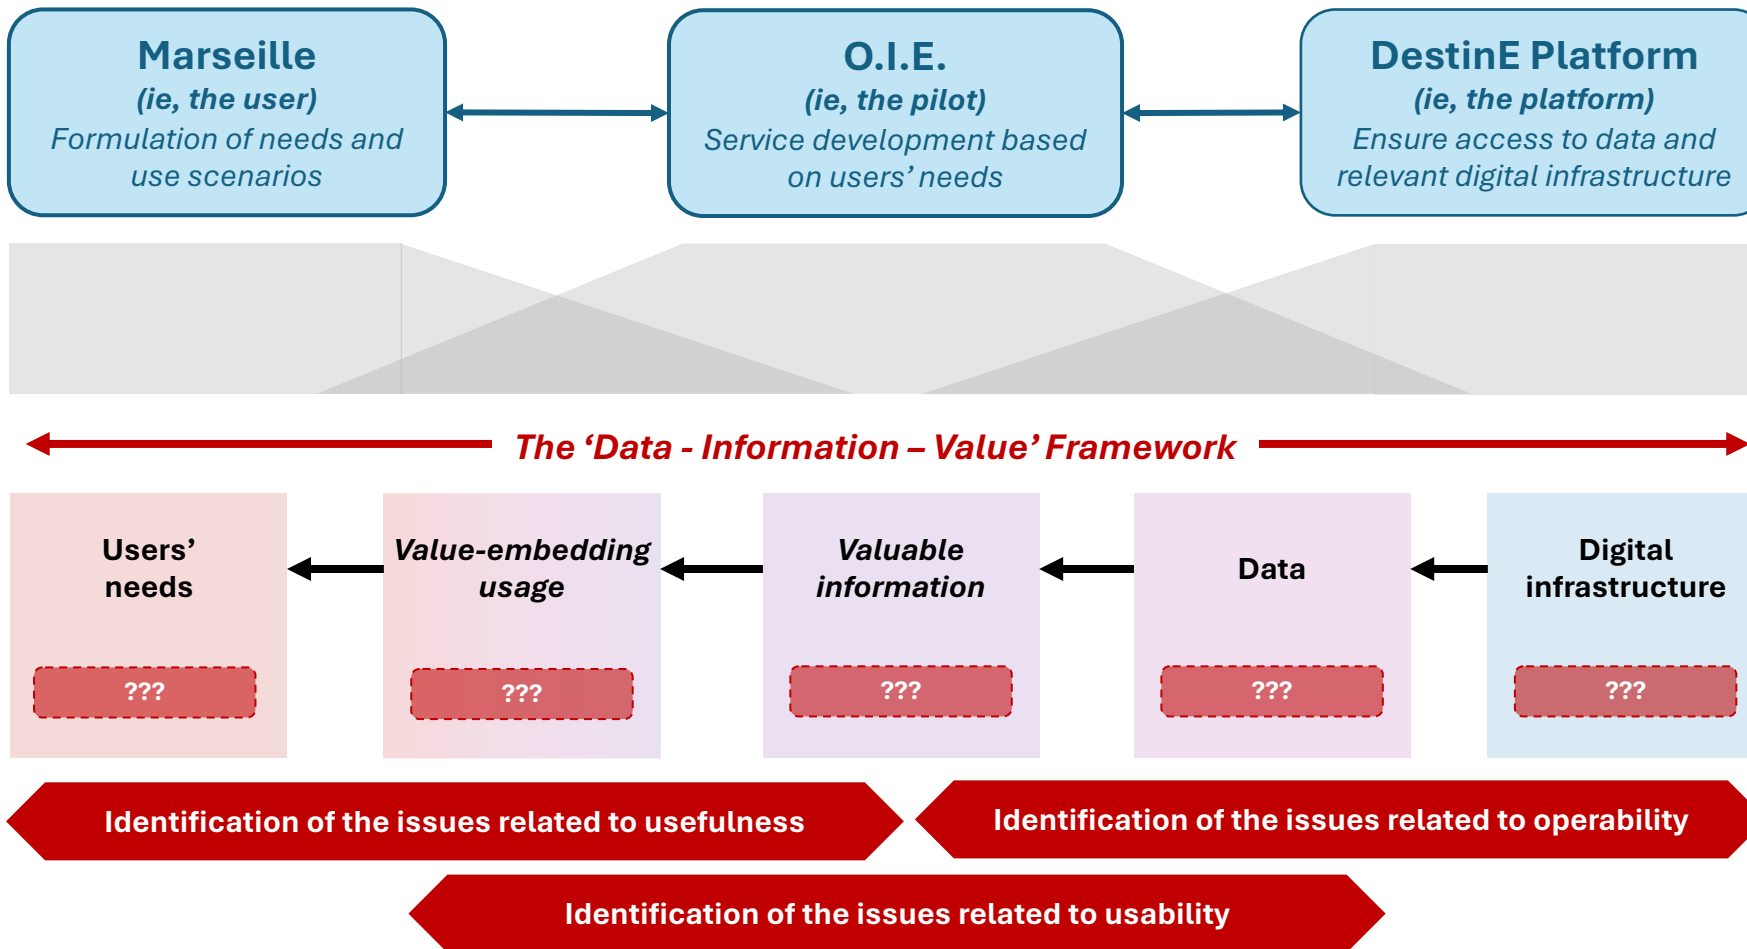

Such a co-design journey serves a variety of design objectives beyond 'one-shot' service development

- ✓ To set the ground and foster subsequent collaborations around other potential services
- ✓ To develop a collective ability to design new services on an ongoing basis
- ✓ To develop stakeholders' individual abilities to leverage the platform
- ✓ To set up relational and organizational channels that support coordination between stakeholders

Marseille use- case

The case of Marseille – The diagnosis of co-design needs

Thanks to a careful diagnosis based on the DIV Framework, we identified several critical issues to address through the co-design workshops

- Issues related to usefulness :**
- Identification of the potential users' profile
 - Understanding use contexts and scenarios
 - ...
- Issues related to usability**
- Identification of the skills and tools available
 - Understanding the various users' workstreams
 - ...
- Issues related to operability**
- Identification of the data required
 - Identification of the data processing required
 - ...

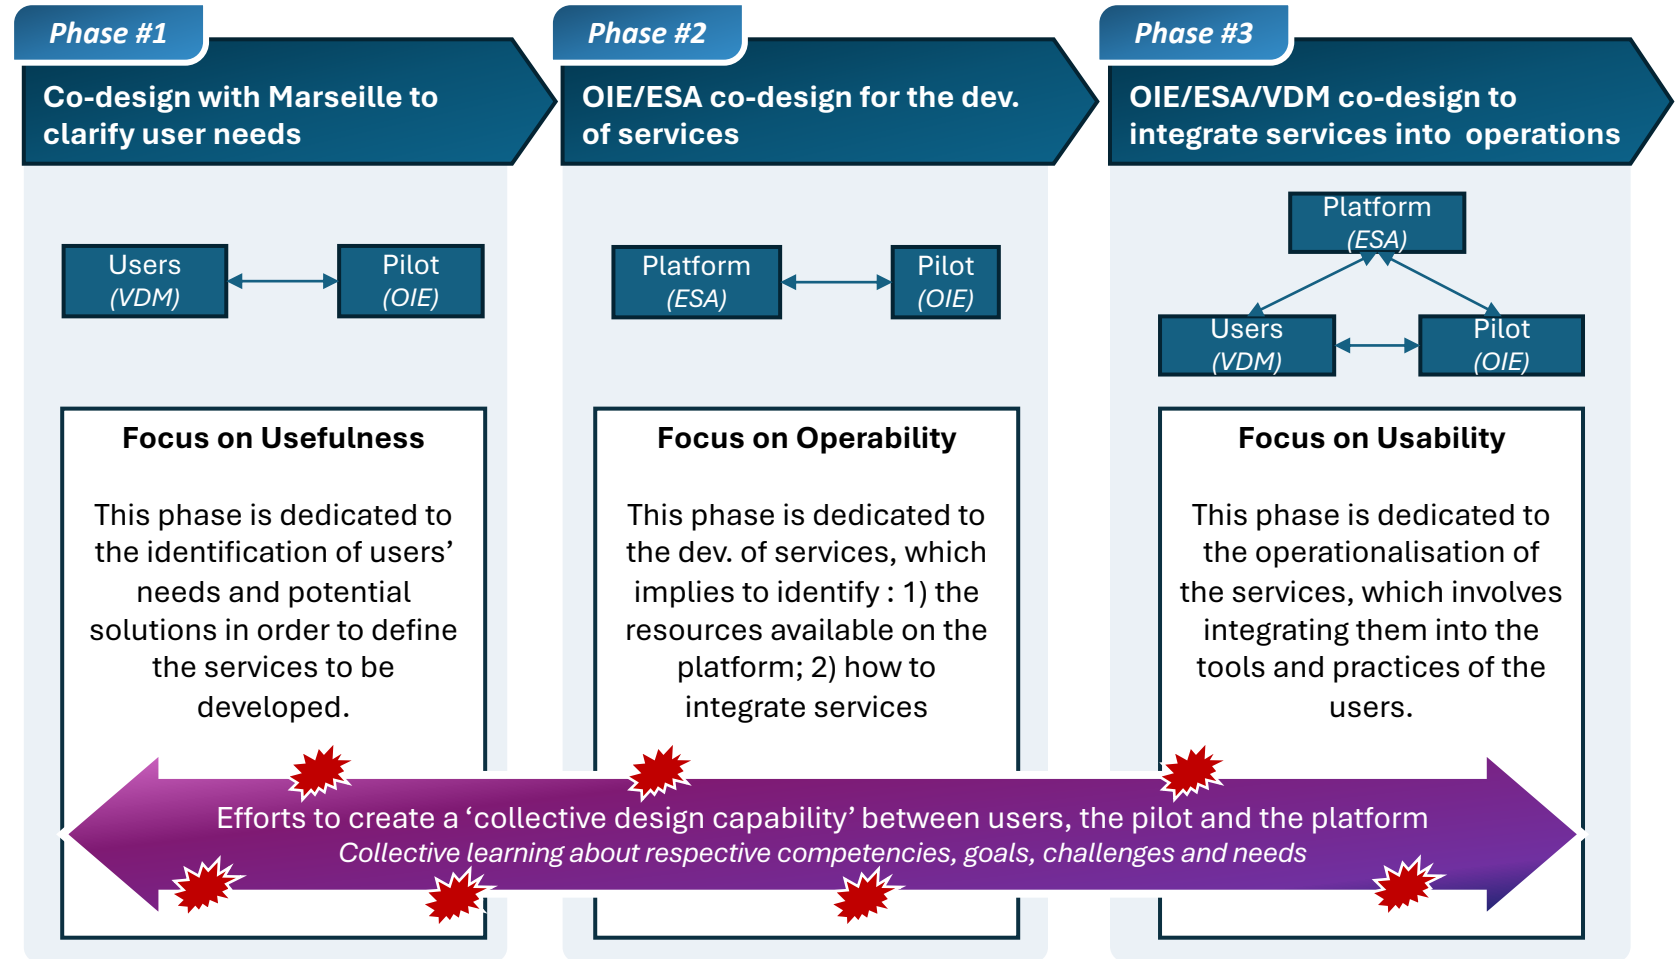

The case of Marseille – The co-design workshops organized in three phases

Based on the challenges identified during the diagnosis, we decided to structure the co-design sessions in three phases

Phase 1 – Clarification of the users' needs (to reach usefulness)

Phase 2 – Clarification of the development process (to reach operability)

Phase 3 – Integration within the operations of the city of Marseille (to reach usability)

The case of Marseille – Focus on the phase #1 with Nature in Town (1/6)

Co-Design Workshops

Agendas designed to gradually build a constructive dialogue with users

Ideation supported by generic template to help users to formulate their needs

Close interactions facilitated by the co-design sponsor

The case of Marseille – Focus on the phase #1 with Nature in Town (2/6)

Phase #1

Co-design with Marseille to clarify user needs regarding Nature in Town

Workshop #1.1

Objectives :

Specify the operational needs of the city of Marseille

Participants :

City operational agents

Workshop #1.2

Objectives :

Enrich the list of requirements for each subjects

Participants :

City planners & local experts in Geographical info. system

Workshop #1.3

Objectives :

Identify consistent answers to the needs formulated

Participants :

Internal workshop with OIE and CGS

Workshop #1.4

Objectives :

Validation of the strategy for answering the needs with feasible specifications

Participants :

Head of the Nature in Town commission

- The focal user and the pilot are required to explore the problem space as to **address the issues related to identifying potential value (usefulness)**;
 - The **first workshop** is dedicated to the exploration of the problems encountered by the main potential users related to managing nature in town.

Theme	Description
Drought warning	In the event of a drought warning, the prefecture prohibits the watering of parks and gardens, which threatens their role as islands of freshness
Participatory referencing of trees	Trees in the private domain are not referenced in the city's GIS. However, they are an integral part of nature in the city: pest management, coolness, etc.
...	...

The case of Marseille – Focus on the phase #1 with Nature in Town (3/6)

Phase #1

Co-design with Marseille to clarify user needs regarding Nature in Town

Workshop #1.1

Objectives :

Specify the operational needs of the city of Marseille

Participants :

City operational agents

Workshop #1.2

Objectives :

Enrich the list of requirements for each subjects

Participants :

City planners & local experts in Geographical info. system

Workshop #1.3

Objectives :

Identify consistent answers to the needs formulated

Participants :

Internal workshop with OIE and CGS

Workshop #1.4

Objectives :

Validation of the strategy for answering the needs with feasible specifications

Participants :

Head of the Nature in Town commission

- **The second workshop** is dedicated to the exploration of the problems encountered by other potential users, in the local ecosystem around Marseille

Users	Ecologists, botanists
Context	Tree planting and maintenance
Activities concerned	<ul style="list-style-type: none"> • Selection of species, and creation of plant palettes • Tree planting and maintenance
Nature of the problem encountered	The species planted do not always take into account the present and future local eco-climatic conditions of the site
Information needs	<ul style="list-style-type: none"> • Species-climate relationships • Climatological data (temperature, local rainfall, etc.)
Use of Information	<ul style="list-style-type: none"> • Estimation of changes in the local climate in 5-50-100 years • Identification of geographical areas that already have this climate profile • Definition of inclusion/exclusion criteria for species

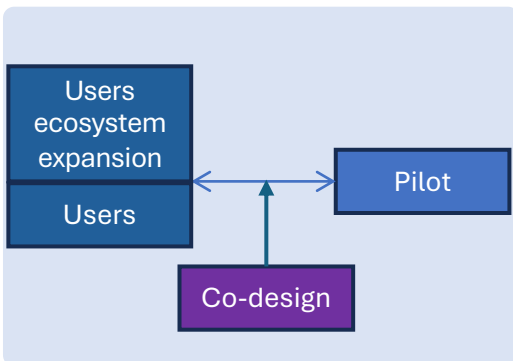

Possible services:

Short-term PoC:

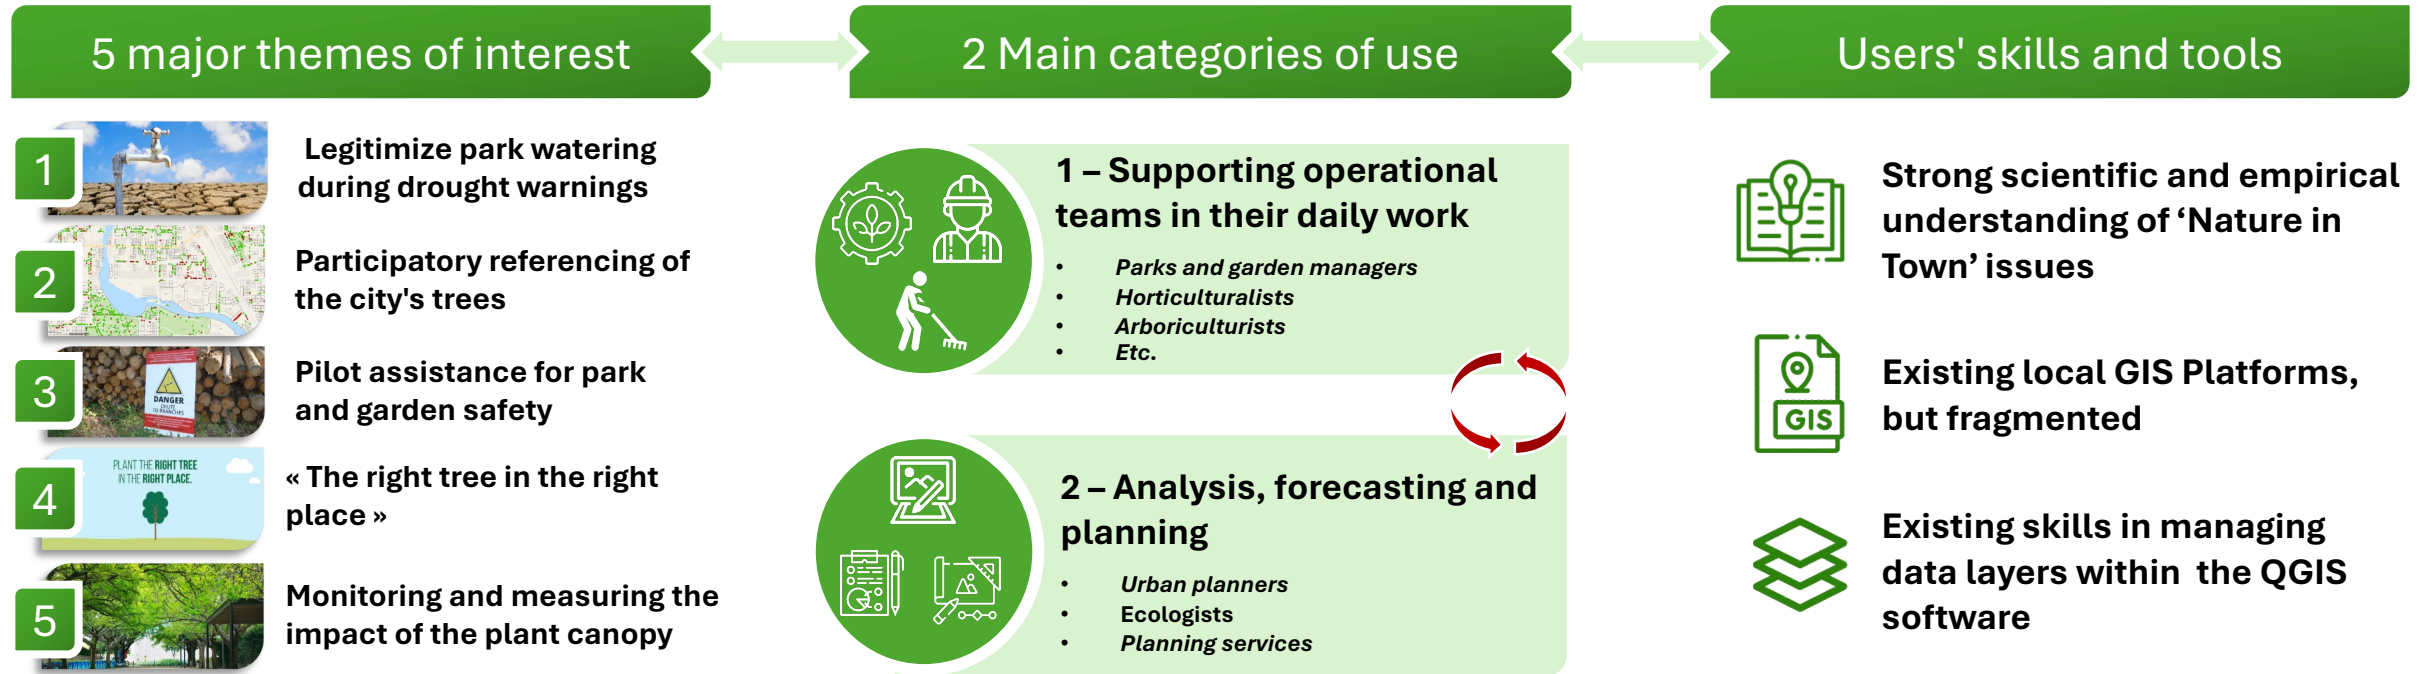

Creation of maps to identify areas conducive to certain species according to a series of criteria: Rainfall (T0 and T+10)..

Long-term solution:

Creation of a taxonomy of local species adapted to climate trends and city uses

A co-design methodology tailored for future DestinE cases

3 principles of our strategy to meet expressed needs

Exploit commonalities between expressed needs

Propose generative solutions

Capitalize on existing skills

The case of Marseille – Focus on the phase #1 with Nature in Town (5/6)

Phase #1

Co-design with Marseille to clarify user needs regarding Nature in Town

Workshop #1.1

Objectives :

Specify the operational needs of the city of Marseille

Participants :

City operational agents

Workshop #1.2

Objectives :

Enrich the list of requirements for each subjects

Participants :

City planers & local experts in Geographical info. system

Workshop #1.3

Objectives :

Identify consistent answers to the needs formulated

Participants :

Internal workshop with OIE and CGS

Workshop #1.4

Objectives :

Validation of the strategy for answering the needs with feasible specifications

Participants :

Head of the Nature in Town commission

- **The third workshop** is dedicated to unravelling existing systems that could answer, at least partly, the problems encountered by the potential users.

	Thème 1 Légitimer l'arrosage des parcs en cas d'avis de sécheresse	Thème 2 Le référencement participatif des arbres de la ville	Thème 3 Assistance au pilotage pour la sécurité des parcs et jardin	Thème 4 « Le bon arbre au bon endroit »	Thème 5 Suivi et mesure de l'impact de la canopée végétale

Head of the Nature in Town

The case of Marseille – Focus on the phase #1 with Nature in Town (6/6)

Phase #1

Co-design with Marseille to clarify user needs regarding Nature in Town

Workshop #1.1

Objectives :

Specify the operational needs of the city of Marseille

Participants :

City operational agents

Co-Design tools Used :

- User profil Canvas
- User journey canvas

Workshop #1.2

Objectives :

Enrich the list of requirements for each subjects

Participants :

City planers & local experts in Geographical info. system

Co-Design tools Used :

- Canvas to enrich user specifications

Workshop #1.3

Objectives :

Identify consistant answers to the needs formulated

Participants :

Internal workshop with OIE and CGS

Co-Design tools Used :

- Theme-to-Tech Mapper Matrix

Workshop #1.4

Objectives :

Validation of the strategy for answering the needs with feasible specifications

Participants :

Head of the Nature in Town commission

Exploration of users' needs

Five subjects of interest identified :

1. The right tree at the right place
2. Monitoring the plant canopy
3. Measuring the impact of drought orders
4. Park safety management
5. Participative referencing of trees

Enriched list of requirements for each of the subjects of interest

Specifications and strategy for meeting needs :

- Identification of relevant data to meet needs
- Identification of commonalities between needs
- Formulation of a service architecture concept

Validation of the specifications and the strategy for meeting needs

Relational perspective

- A first discovery of the potential users' profiles, goals, concerns, work habits
- A better understanding of the pilot capabilities by the potential users
- Definition of the collaboration strategy

- Better understanding of users' competencies, tools and design capabilities

Refining the pilot goals and vision to align with the expectations and capabilities of potential users, thereby establishing a shared foundation for effective collaboration.

Crystallising a shared vision and a way of working together

The case of Marseille – Focus on the phase #1 with Nature in Town (6/6)

Co-design assumptions

The core of the process resides in the workshop sessions, where collaborative interactions are believed to foster the most critical advancements

Focus on a single type of stakeholder or set of needs.

Focus on offering a solution tailored to a single defined need, based primarily on the expertise at hand.

Co-design for DestinE

The diagnosis enlightened the co-design needs: a progressive exploration of the problem and solution spaces would be necessary to foster both contextualization and retrofit towards genericity.

Leverages the expansion of the user base and the scope of usefulness.

Exploration of both existing and potential technological bricks, as well as the commonalities among various requirements, to deliver a solution that addresses a portfolio of needs while ensuring its resilience.

An example through the case of Marseille

Brice Dacheux-Auziere

Figure 1: The key challenges addressed by the Co-Design methodology

Overall, co-design can be defined as « A form of collaborative innovation that puts a specific emphasis on the need of co-inventing the relationships between the involved actors » (Bucher, 2023) It encompasses three critical aspects:

- A design aspect: the need to explore innovative solutions beyond existing services and starting from user needs.
- A collective aspect: The need to involve heterogeneous actors along the design journey
- A crisis aspect: The need of re-inventing the relationships between the actors when there is no obvious way to interact

Both academia and practice have enlightened that 'designing the co-' is at the very earth of every successful co-design initiative. It means that the objective of co-design does not only lies

Figure 2: The four steps of the Co-Design Journey

2.2. Introduction to the diagnosis phase

The Co-Design Diagnosis phase is critical to assess the co-design needs. The goals of this diagnosis are to clearly identify the state of both the technical system and the relationships between the actors as to identify the missing pieces, the key challenges to face, and to structure a consistent Co-Design action plan. Consequently, the co-design workshops must be organized based on this careful diagnosis, which determines, in large part, the overall success of the Co-Design journey.

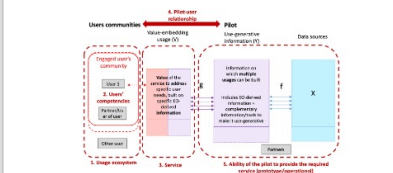

Figure 3: Representation of the 'data journey' for the targeted state based on the data-information-usage framework: data (in blue), information (in purple), usage (in purple/red), function "f" linking data and information, function "g" linking information and usage are the different constitutive elements of the service, addressing a certain users' community (in red)

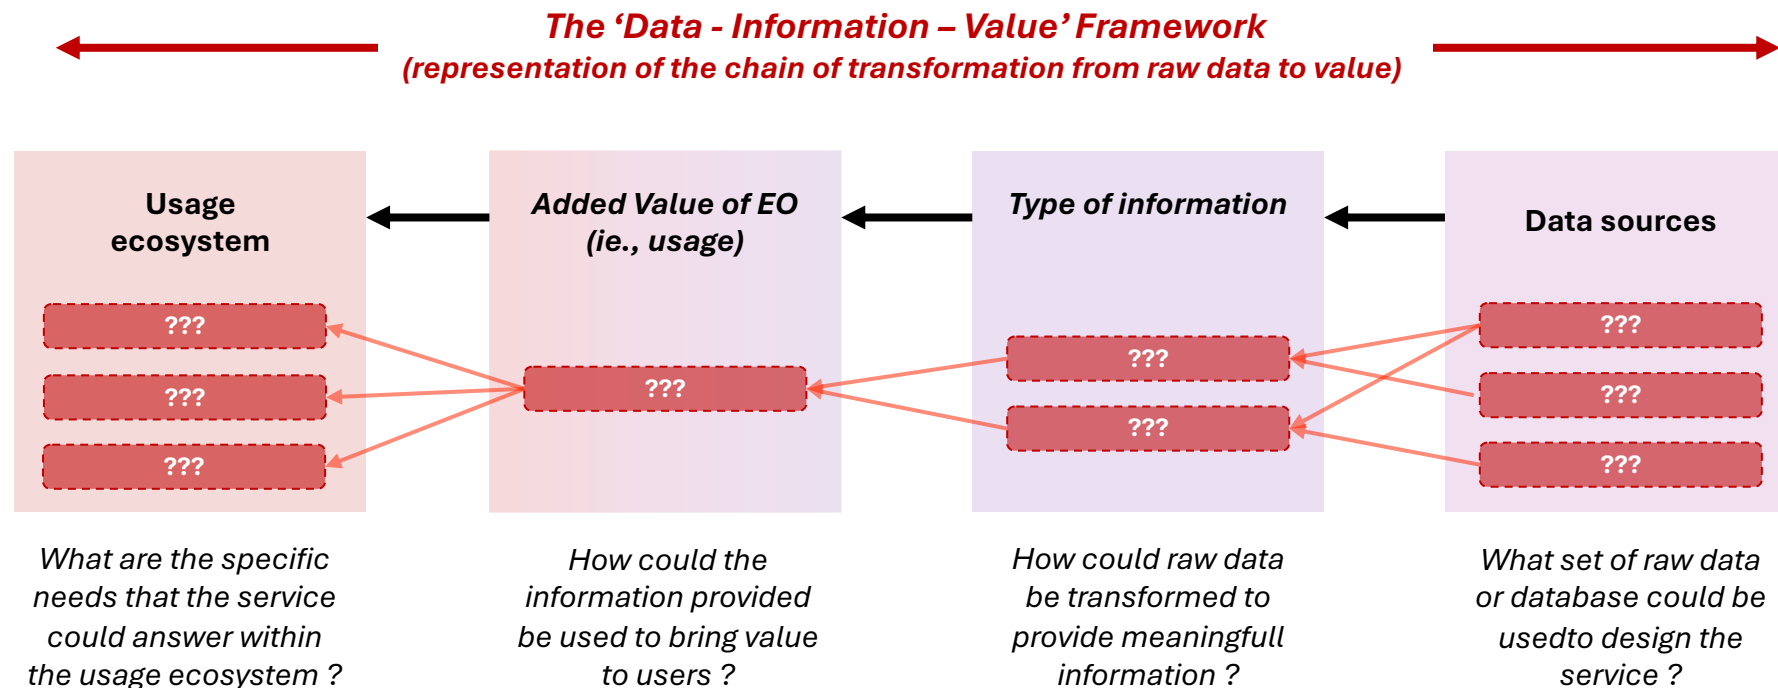

Q&A

II.
**Introduction to the interactive
part of the workshop**

Introducing the 'Data – Information – Value' (DIV) Framework

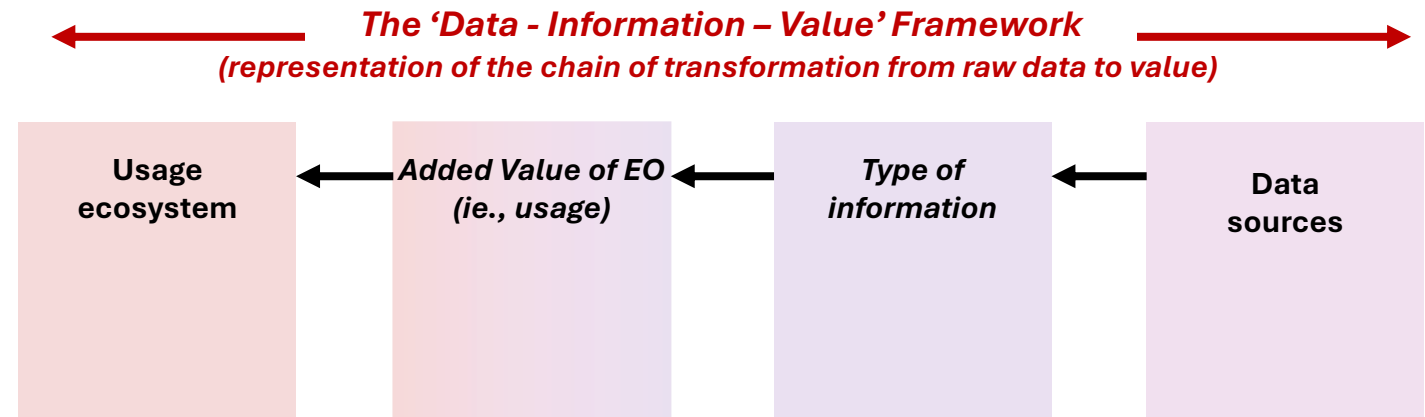

- The DIV Framework is a critical tool both to diagnose co-design needs and to follow the evolution of the co-design process.
- It allows to decompose the potential service from raw data to value adding services.
- It supports a clear identification of the specific challenges related to each steps of service development

Introducing the 'Data – Information – Value' (DIV) Framework

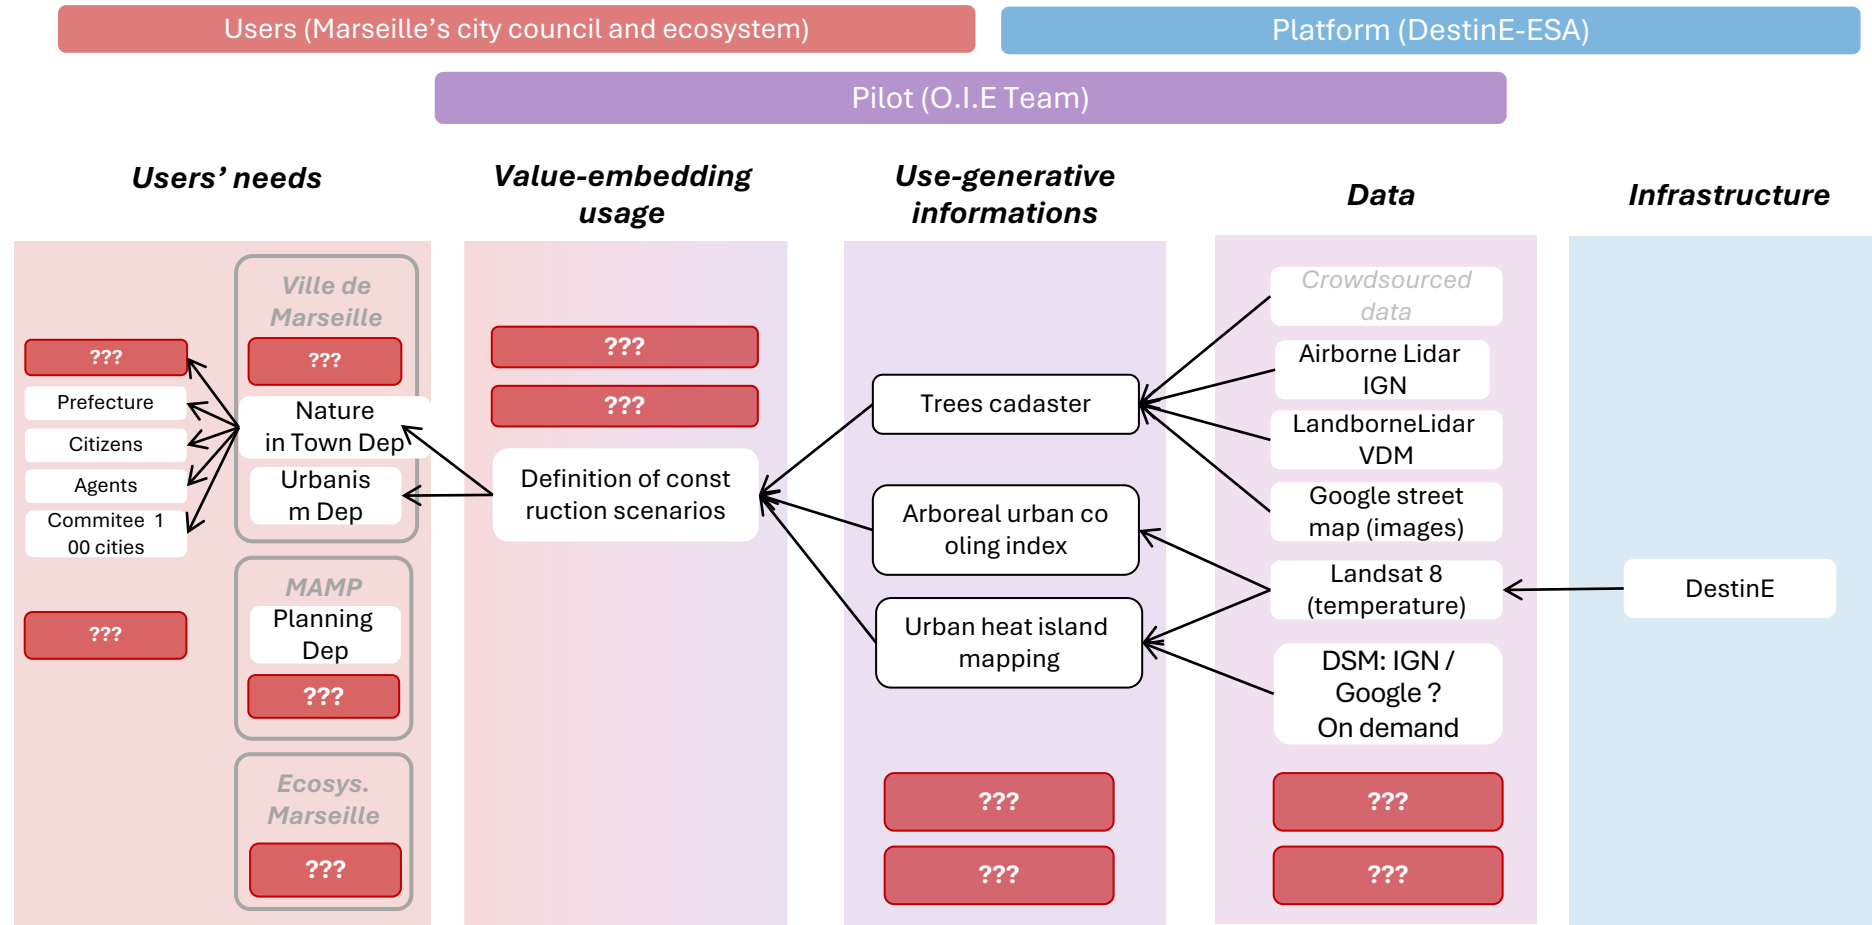

The DIV Framework supports a progressive diagnosis of the co-design needs that can be performed through the following steps :

1. Broadly define the targeted service
2. Specify the potential user of the service to be designed and the needs to be adressed
3. Explore the usage ecosystem as to understand the structure of interactions and the challenges that must be faced
4. Envision the chain of data transformation that must be structured to bring value to the users

Introduction to the interactive part of the workshop

Example of the 'Data – Information – Value' (DIV) Framework

Introducing the DIV template for the diagnosis

Objectives of the interactive part of the workshop :

Based on the following template, you are asked to diagnose a service of your choice as to identify the key challenges to face through co-design

The final goal of the exercise will be to envision the structure of co-design workshops that could be relevant to design the service

- **Choose an example you are familiar with where data is being used for the development of a climate service.**

Exercise 1: Diagnosis

1) Fill in the blanks (Insert **organization name**) aims at developing new services for (Insert **targeted usage ecosystem**) with (Insert **main data sources and EO-derived information**)

Usage ecosystem

3) Indicate further knowledge on the **ecosystem of these users** (users of users, other key players, etc.)

2) Specify the users with whom you will have direct interaction, the identified **contact points**, and the **assumed use-case**

4) Added value of EO: what **type of product/service** (monitoring, decision support, scenario design, etc.)? Type of information: what data is generated and what is its specificity (resolution, timescale, etc.) Data sources: database (CMEMS, users' in-situ data, Sentinel-1, etc.) and any other relevant information (type of data, resolution, geographical coverage, etc.). Please be concise!

	Added value of EO	Type of information	Data sources
.....
.....
.....
.....

Exercise

Step 1

Broadly define a specific service to be developed :

1. Who will develop the service ?
2. Who are the targeted users ?
3. What are the main data sources and information to be used and/or provided ?

Exercise

Step 2

Specify the targeted users of the service :

1. With whom will you interact ?
2. Who are your potential contact points ?
3. What kind of usage/needs would be addressed (use cases) ?

Exercise

Step 3

Specify the broader usage ecosystem :

1. With whom do your users already interact ?
2. Who could stand as other potential users ?
3. What kind of needs could be addressed in the broader ecosystem ?

Exercise

Step 4

Specify how you will bring value to users :

1. What data must be used ?
2. How the data must be transformed to provide valuable information ? What type of service could be envisioned ?
3. How the information would be used to answer the potential users' needs ?

Exercise Step 5

Identify the key challenges to address through co-design :

1. What are the missing knowledge in your current DIV ?
2. With whom you must interact to complete your DIV ?
3. What kind of co-design sessions could you set up to explore your collective unknowns ?
