

Destination Renewable Energy (DRE) - Use Case

The team

Climate and renewable energy

- Mitigation of **climate change** □ Global and international initiatives □ **Renewables** will play a key role
- UN 2030 Agenda for Sustainable Development : UN Sustainable Development Goal 7
 - 7.1: ensure universal access to affordable, reliable, and modern energy services
 - 7.2: increase the share of renewable energy in the global energy mix

- UN agreements and EU Initiatives
 - The Paris Climate Agreement
 - Green Deal

Paris agreement

“Aims to strengthen the global response to the threat of climate change, in the context of sustainable development and efforts: Holding the increase in the global average temperature to well below 2°C above pre-industrial levels and pursuing efforts to limit the temperature increase to 1.5°C above pre-industrial levels”

European Green Deal

The production and use of energy account for **more than 75% of the EU’s greenhouse gas emissions**. **Decarbonising the EU’s energy system** is therefore critical to reach our 2030 climate objectives and the EU’s long-term strategy of achieving carbon neutrality by 2050.

Green deal priorities

- Ensuring a **secure and affordable EU energy supply**
- Developing a **fully integrated, interconnected and digitalised EU energy market**
- Prioritising **energy efficiency** and developing a power sector based largely on **renewable sources**

Benefits – Needs- Gaps

Societal benefits

- World-wide interdependence of conventional energy production
- Energies and uses of energies have a dramatic impact on global warming, human health and sustainable economic development
- Improved forecasting crucial to integration into electricity grids and for utility, power plant operations & the energy market

Needs

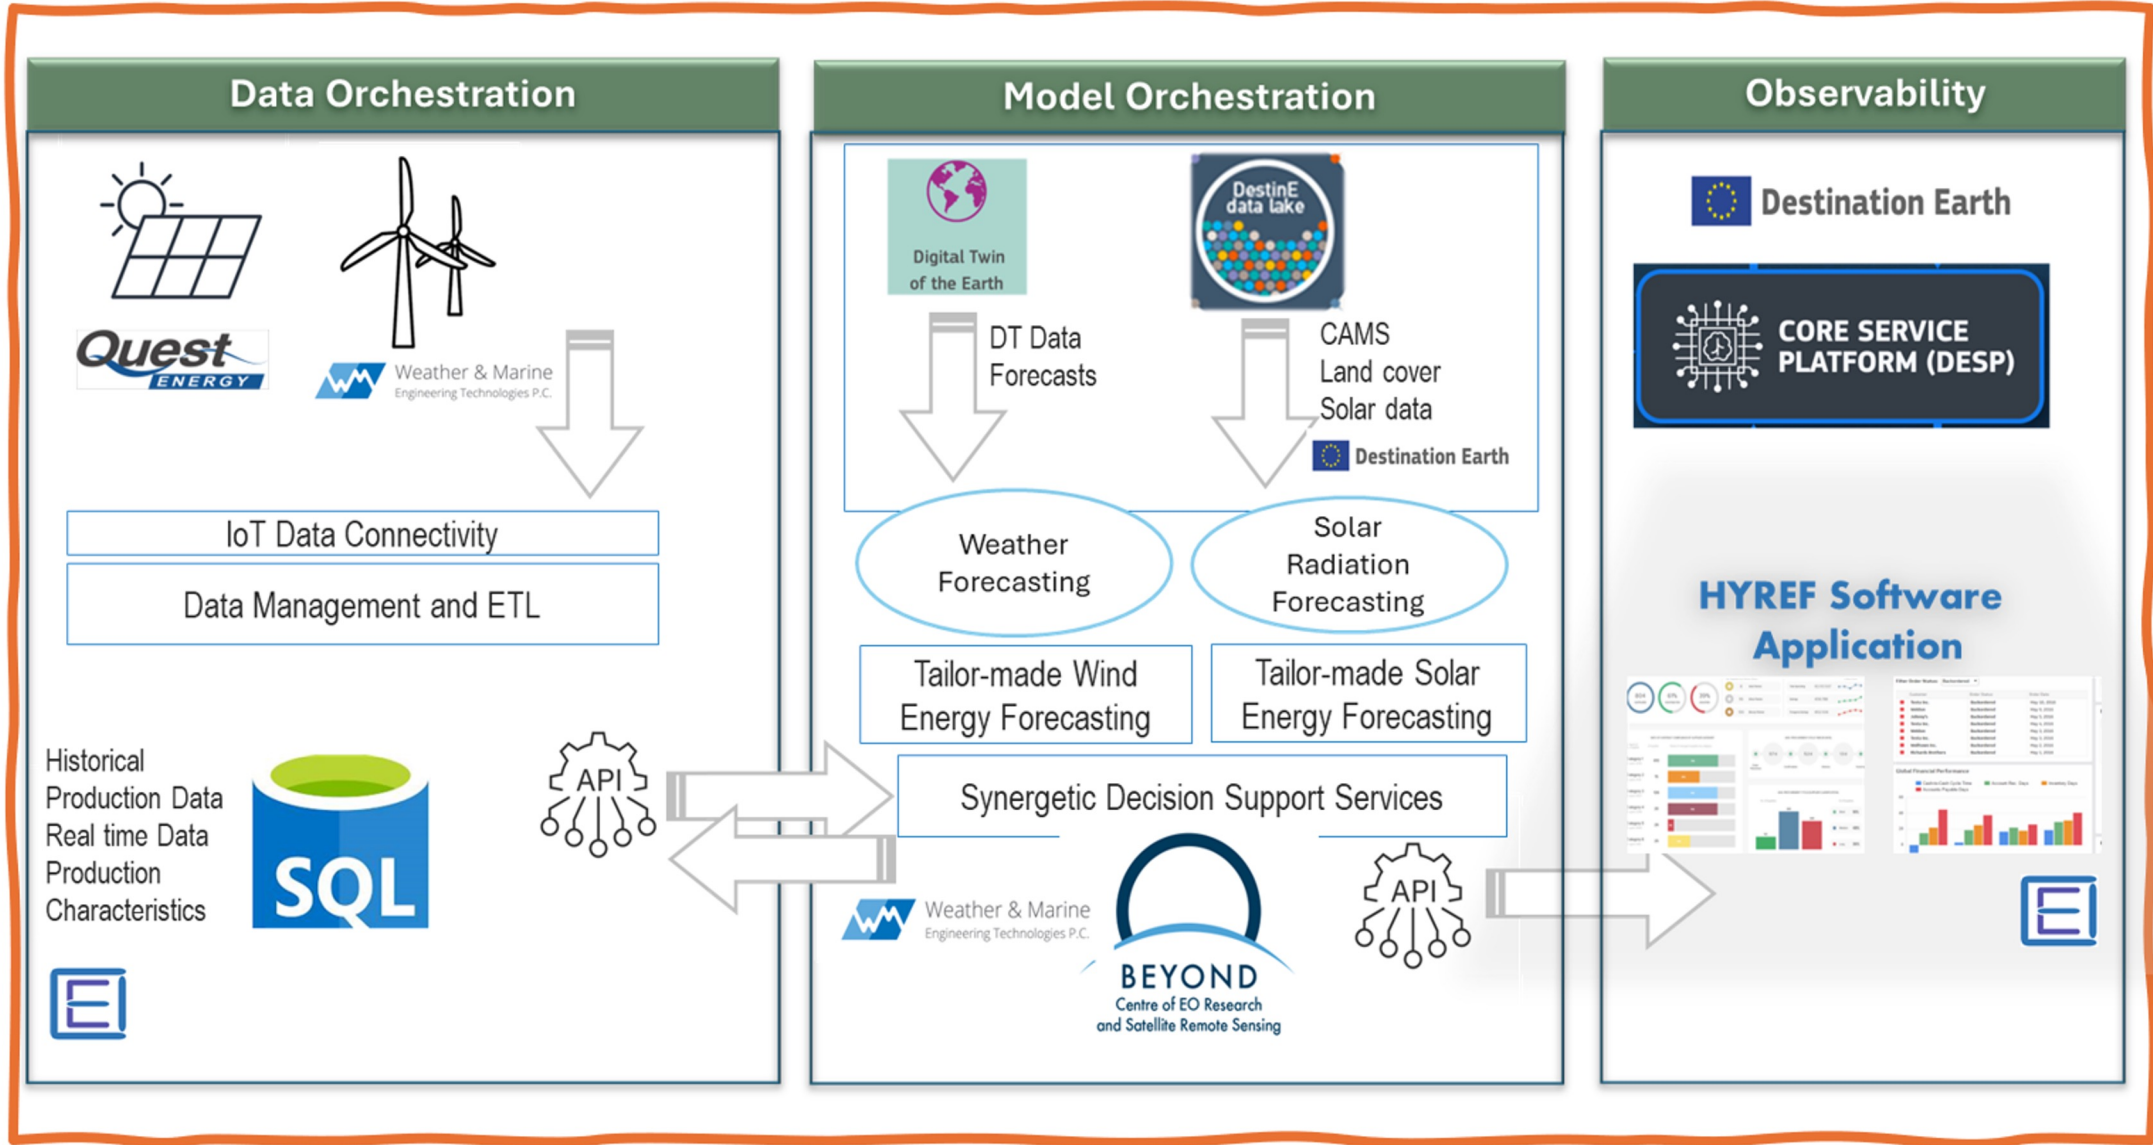

- Weather data archives for site modeling
- Weather forecasting in all timeframes
- Climate analysis and long-term variability
- Data needs: solar, wind, atmosphere, land use, surface roughness, orography, snow cover, vegetation status

Gaps

- Different data sources difficult to handle
- User involvement in product definition is missing
- Delays in data access especially NRT
- Handling of large data amounts
- Spatial and temporal coverage not optimized for energy needs
- Standardisation not sufficient

IRENA, 2021, EU sites.

DRE Conceptual Architecture

Solar power production forecasting model

Input

- **USER** data
- CAMS radiation service (**DEDL**)

Training solar model

Solar model (ML)

production = f (solar radiation, sza, T, RH, wind)

solar model

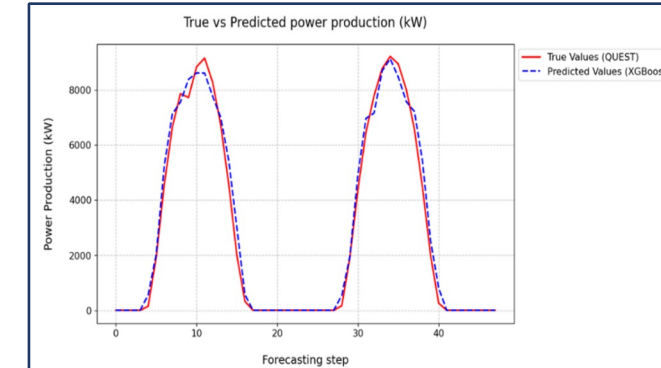

Input

- Digital Twin (**DT**) forecasts
- CAMS global atmospheric composition forecast (**DEDL**)

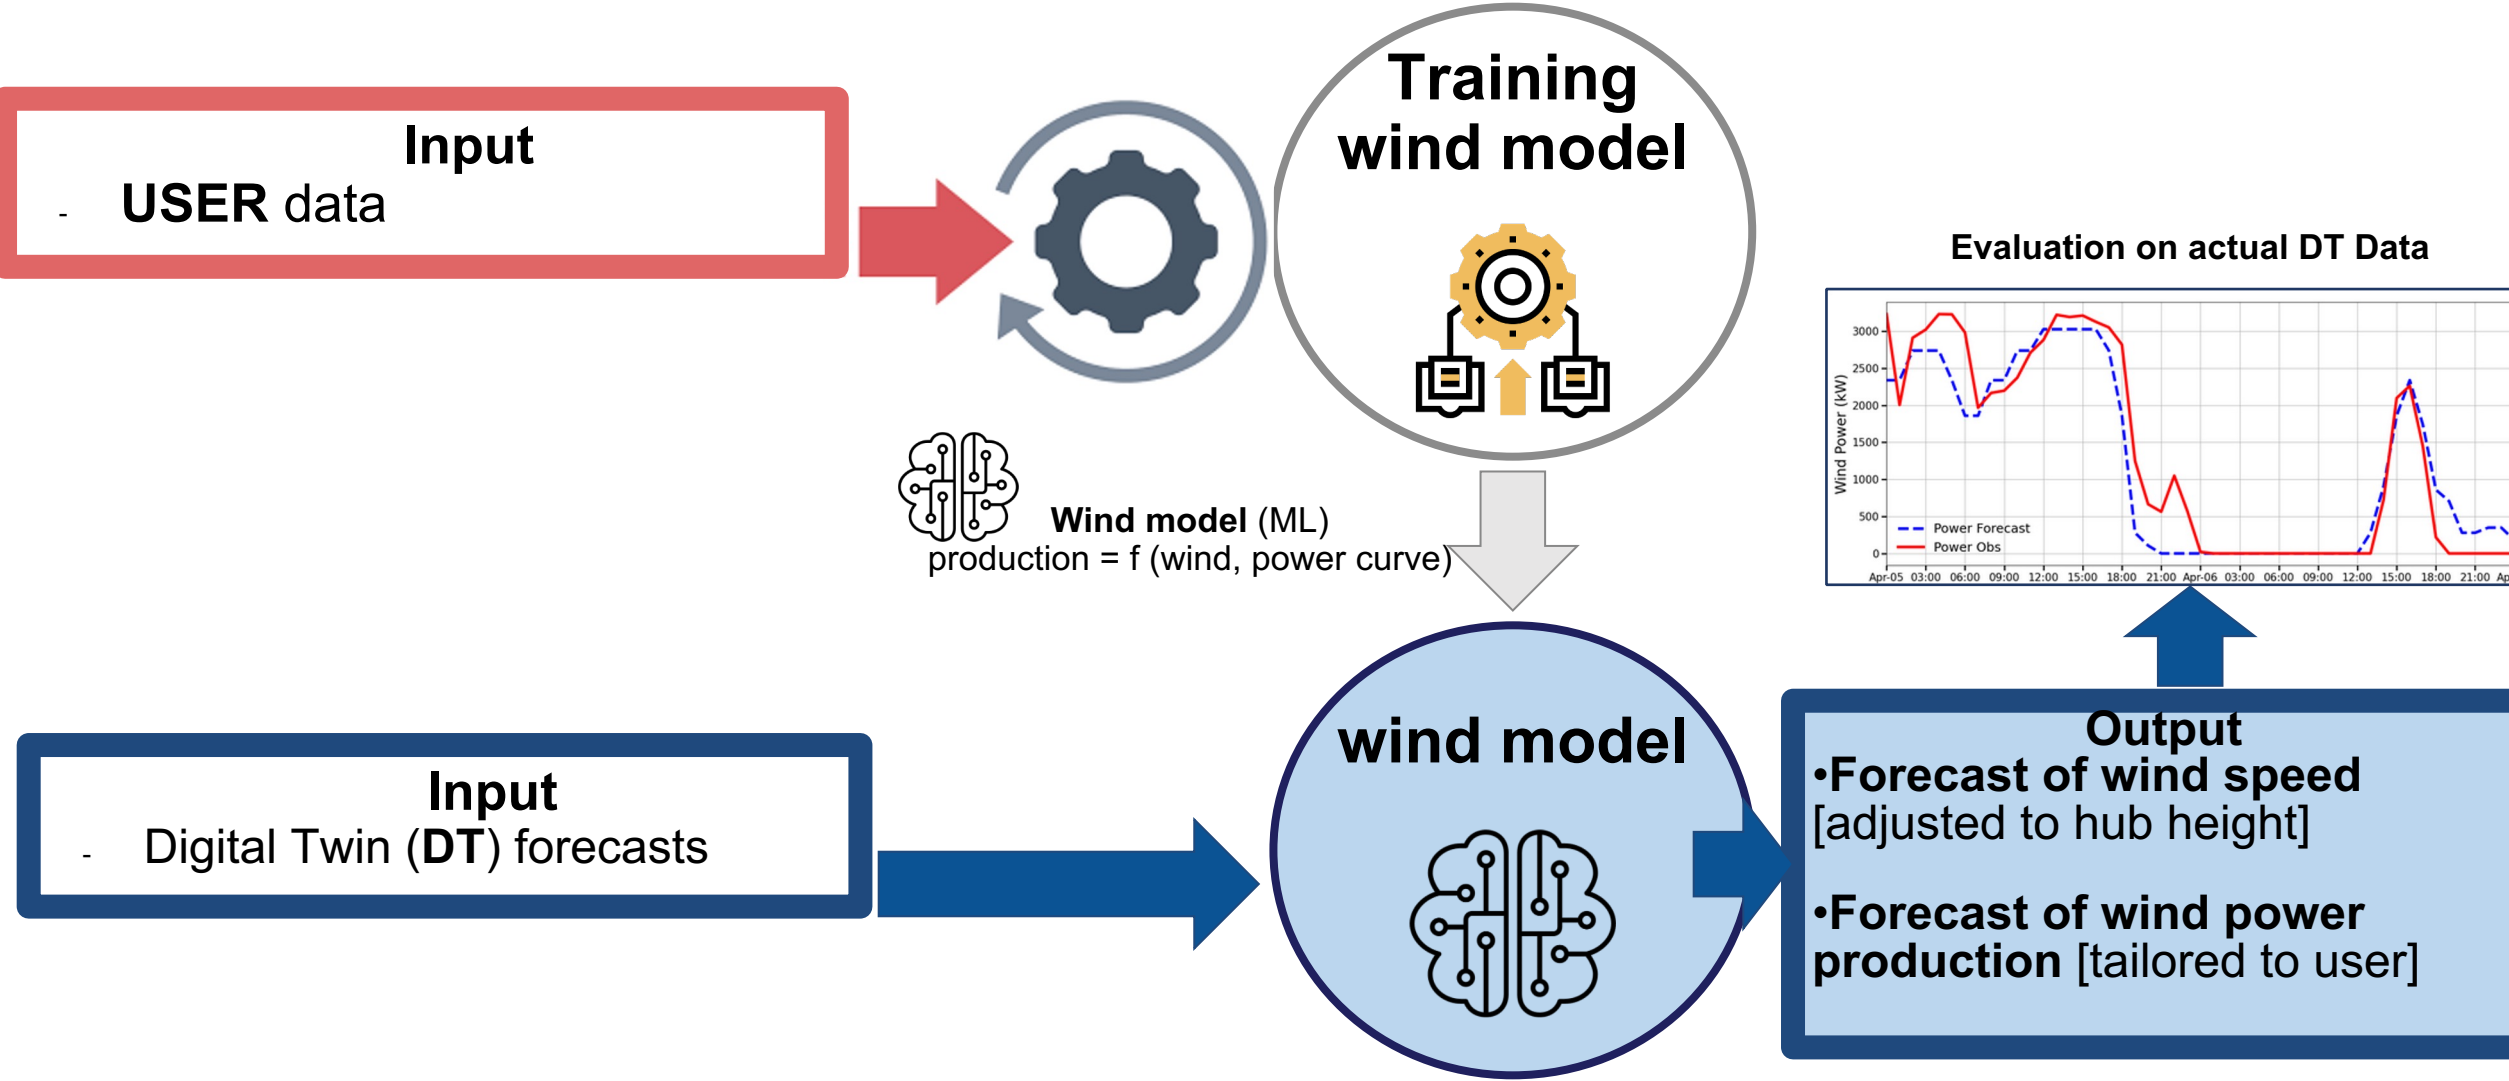

- ## Output
- **Forecast of surface radiation** [the DT output, corrected for aerosol]
 - **Forecast of solar power production** [tailored to user]

Evaluation on actual DT Data

Wind power production forecasting model

HYREF is a Software Application

Supports the digitization of solar and wind production sites

Providing

- Solar radiation assessment and production and 2-day forecasts of Global Horizontal Irradiance (GHI) and solar production
- Wind power production assessment and 2-day forecasts of wind speed and power production
- Hybrid production assessment and 2-3 day forecasts products
- Customisable Production KPIs for power producers
- Plans for Free and Premium Tiers

Solar and wind resource assessment

Uses CAMS solar radiation and wind historical data to provide statistics on the performance and output of the specific power system

Solar and wind forecasts

Models require end-user data to simulate energy production output for user-tailored solar or wind parks

Plant Production parameters

- ❑ HYREF Integration with DestinE (in progress)
 - ❑ DESP service registry integration
 - ❑ Source code security assessment (Guidelines from Serco SonarQube)
 - ❑ DevSecOps operations at test environment
 - ❑ Jira issue-tracking system in place to manage issues or dependencies during this phase

- ❑ Development roadmap of HYREF Software
 - ❑ Hybrid subsystem is already implemented, will continue to improve to all services
 - ❑ Under completion of API input/output for solar/wind forecasts. Onboarding and validate/integrate the services
 - ❑ Fully Integrated Software: Deliver a complete, validated software solution
 - ❑ Integrate HYREF system with solar, wind models, and user feedback, focusing on performance and reliability
 - ❑ Spatial Upscaling
 - ❑ Final UI/UX, finalize a seamless, user-friendly interface
 - ❑ Testing & Documentation, to complete system testing, validation, and provide documentation with training materials
