1. End-to-end demonstration : predicting wind power during storm Eunice

Feb 6th, 2022 : Belgian offshore wind farms generated 94,400 MWh and set a record!

Feb 18th 2022 : Storm Eunice, one of the strongest in 30 years, led to good production but not as good as the mark set a few days before... why?

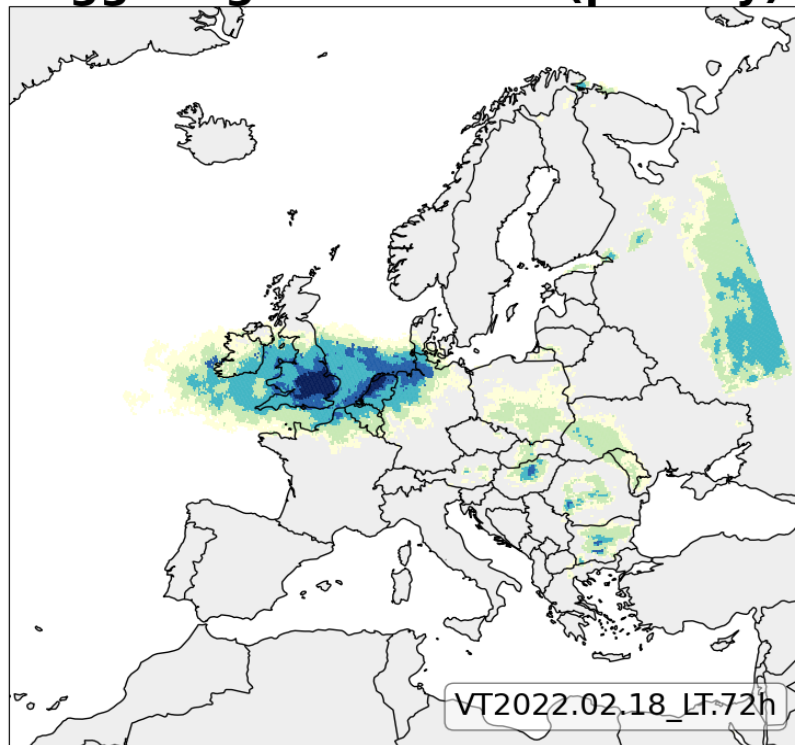

*... this situation was successfully predicted by the prototype
Extremes DT!*

1. End-to-end demonstration : predicting wind power during storm Eunice

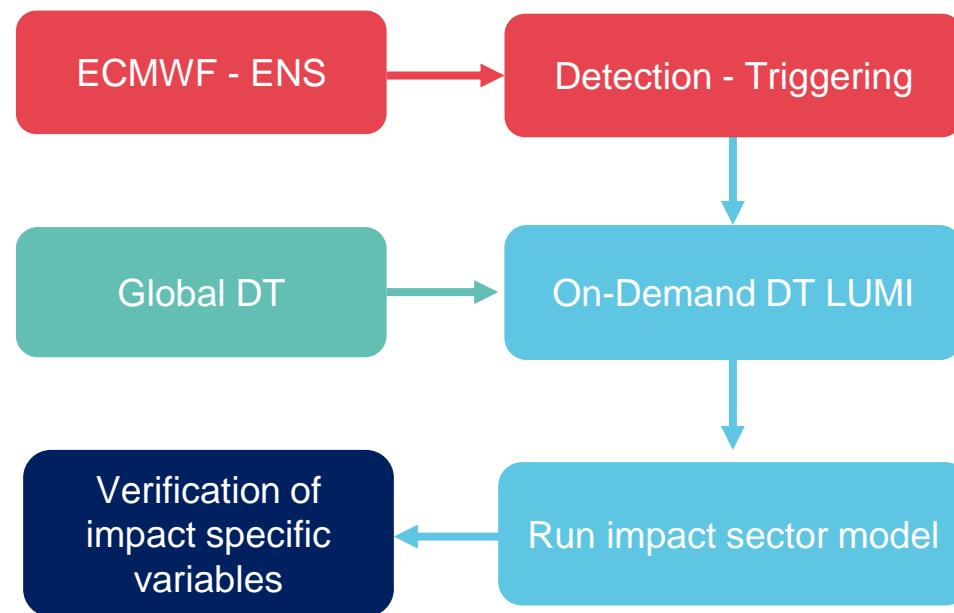

Triggering information (priority)

10m day max wind gust,
 Base time 2022-02-16 00Z
 VT 2022-02-18 (Step 48-72)

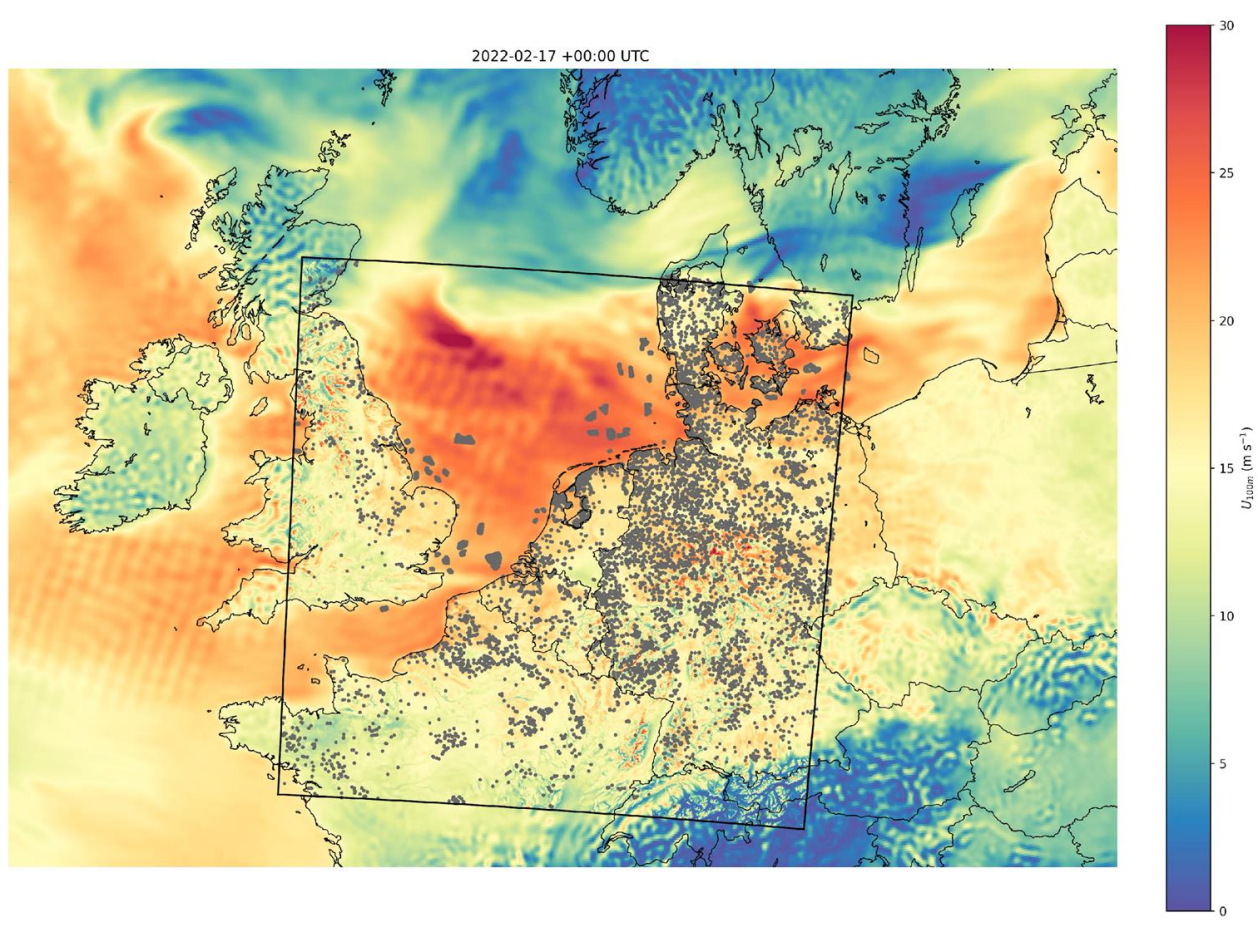

Every day **extreme detection diagnostics**. Alerts for :

- total precipitation
- CAPE shear
- **10m-wind gust**

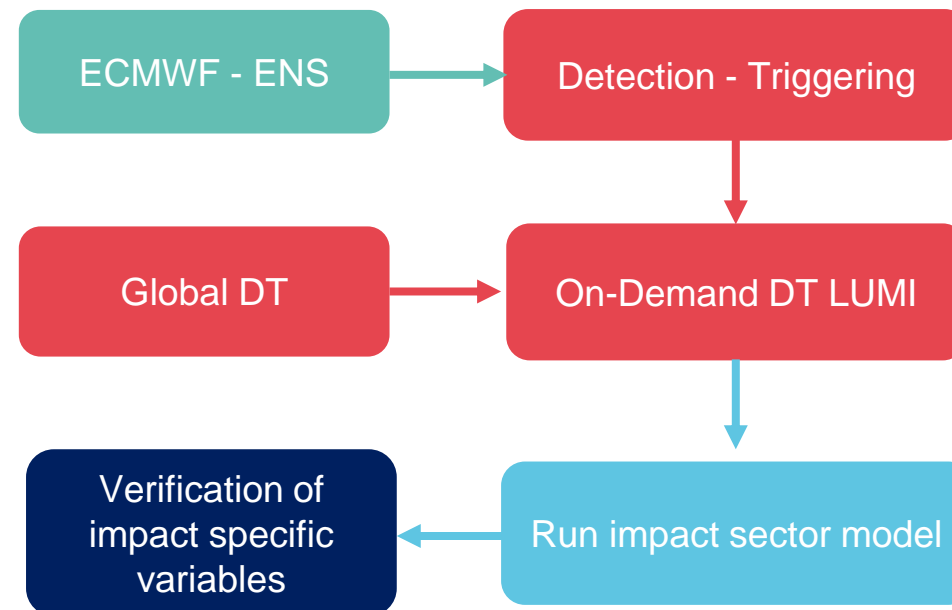

1. End-to-end demonstration : predicting wind power during storm Eunice

100m wind speed

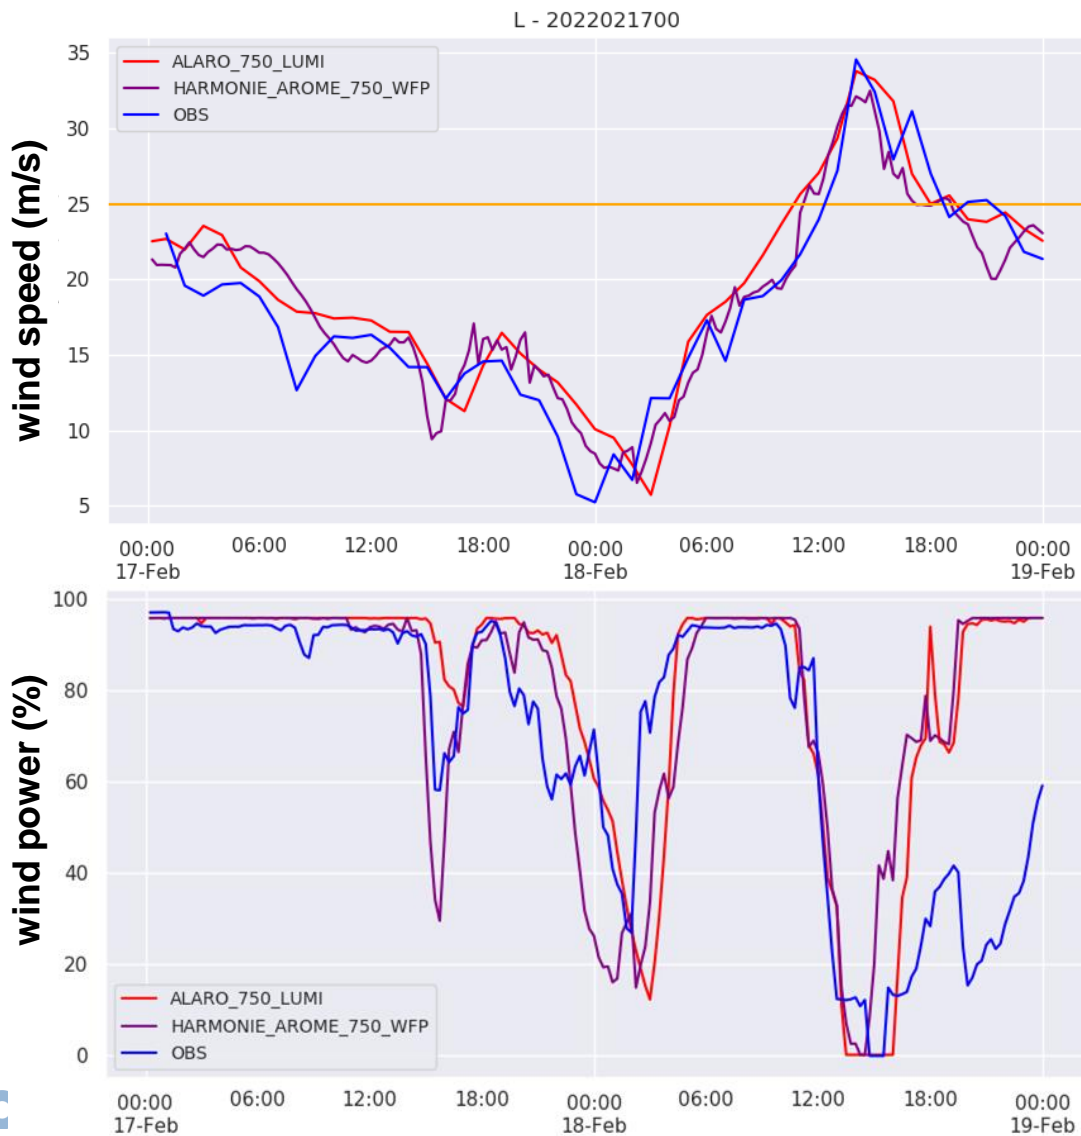

Base time 2022-02-17 00Z

lead time T+0 to T+48

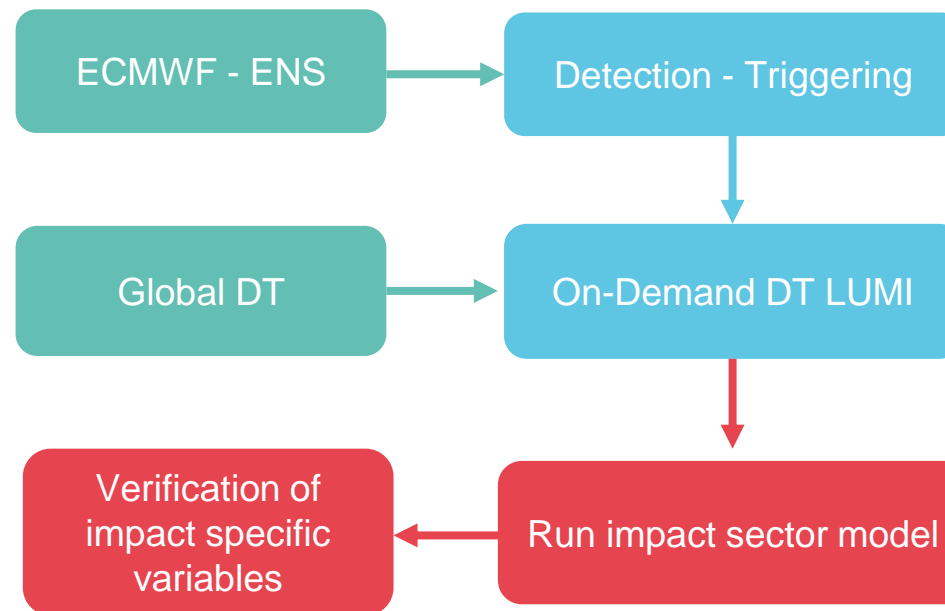

1. End-to-end demonstration : predicting wind power during storm Eunice

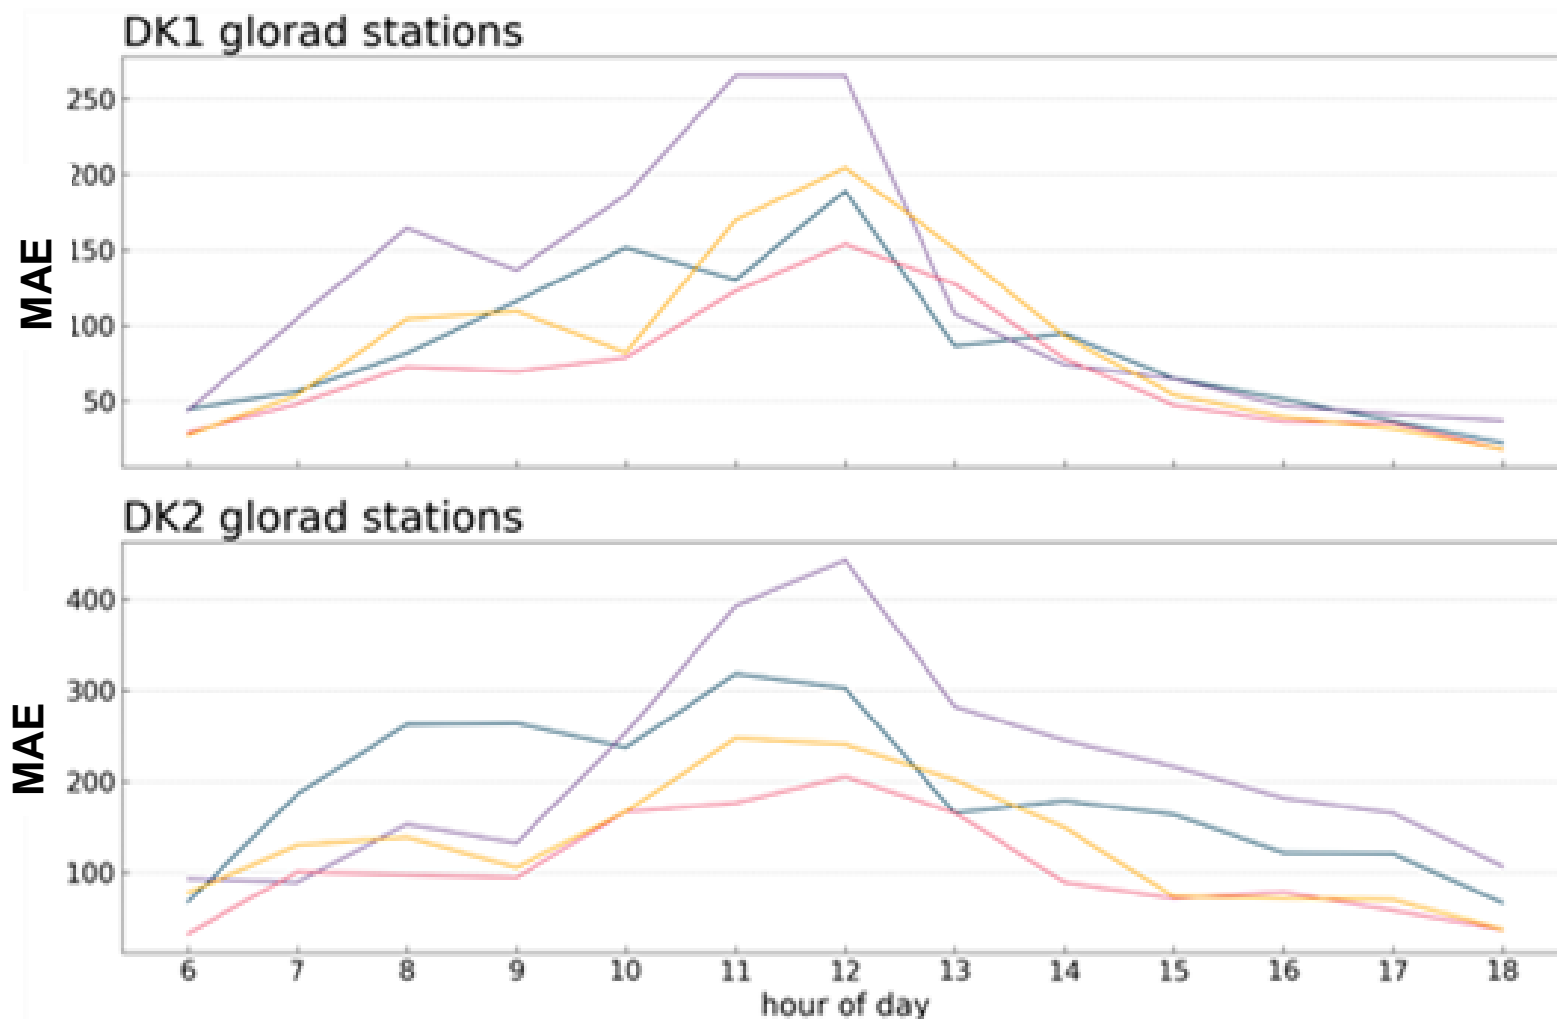

Base time 2022-02-17 00Z
lead time T+0 to T+60

2. Added value higher resolution : solar radiance energy production

Mean Absolute Error (MAE) forecasts from Harmonie (with HARMONIE-AROME CSC) and IrradPhyDNet variants aggregated by regions DK1 and DK2, forecasts from 6:00-18:00 12.6. 2019

2. Added value higher resolution : solar radiance energy production

Harmonie 750m lower errors than 2.5 km in many stations, but not always....more cases studies must be tested

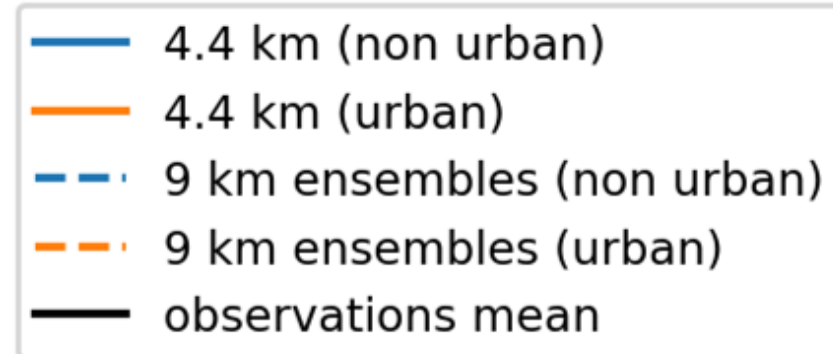

Absolute forecast errors for 15 stations

3. Paris Olympics RDP project: improving 2m temperature forecast in urban areas

Paris city-centre average heat wave July 2022

- **Urban tile** included in the model (IFS cycle 49r1) improves the prediction of urban 2m temperature
- **Resolution** also plays a key role in better predicting the 2m temperature in urban areas (4.4 km deterministic forecast better than any ensemble member with 9 km)

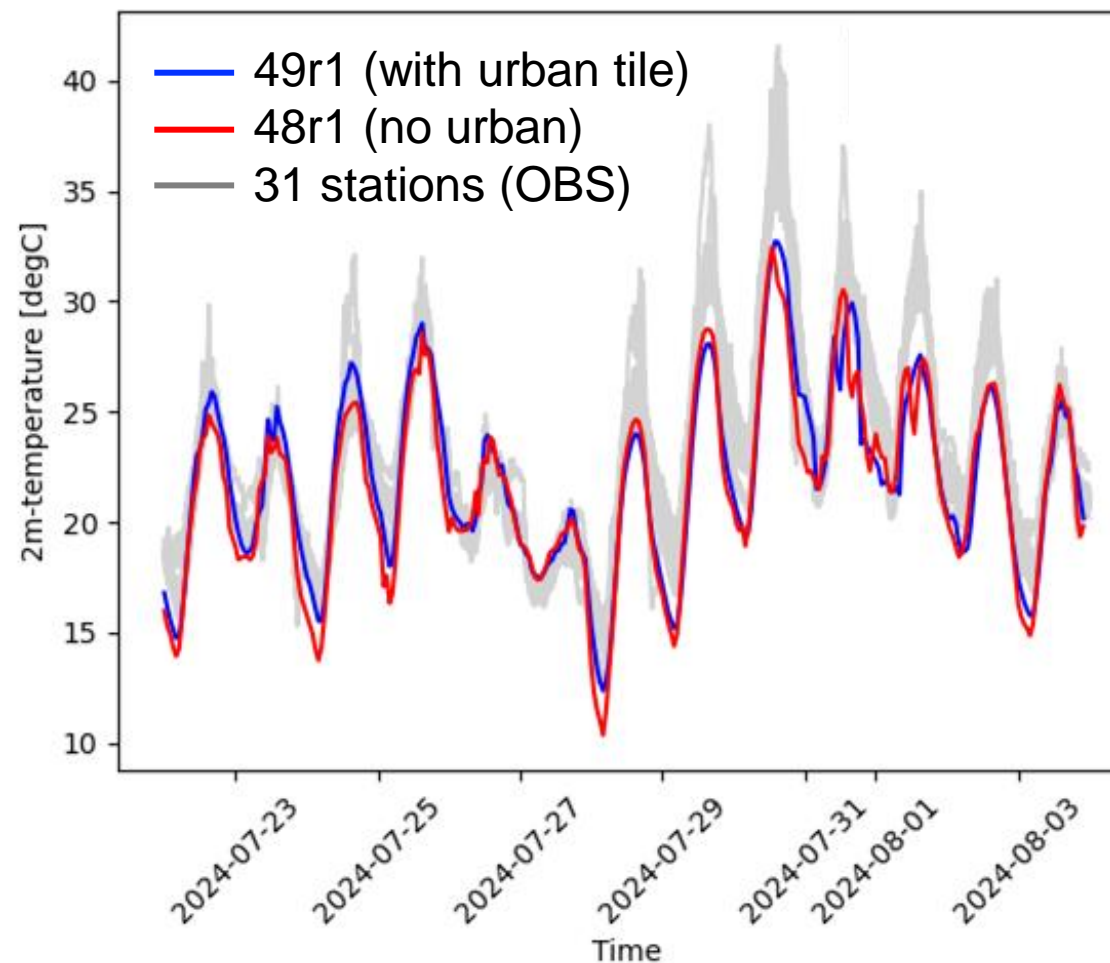

3. Paris Olympics RDP project: improving 2m temperature forecast in urban areas

2m temperature forecast on day 2

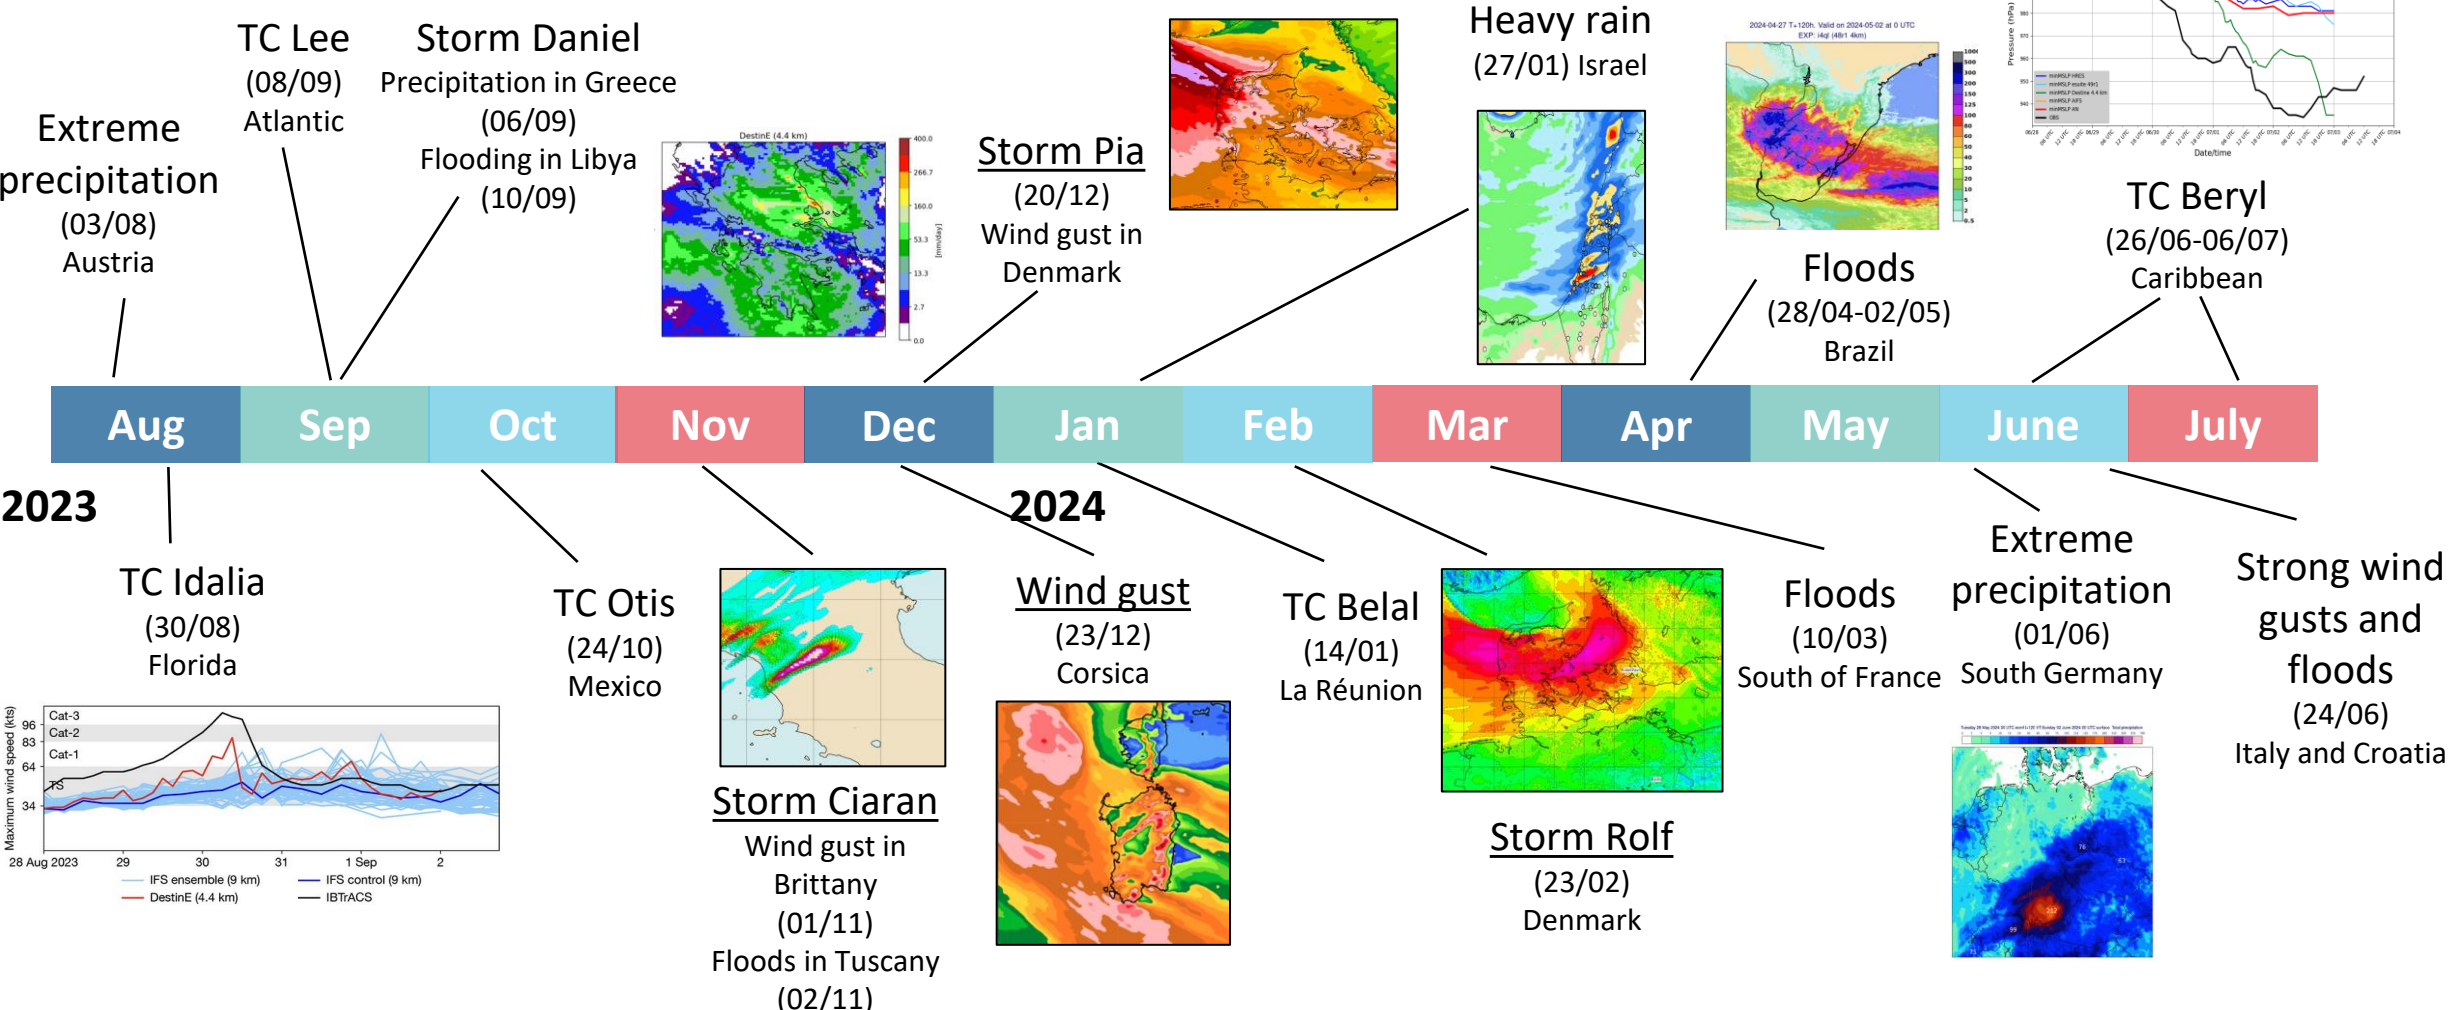

2m temperature forecast on day 2

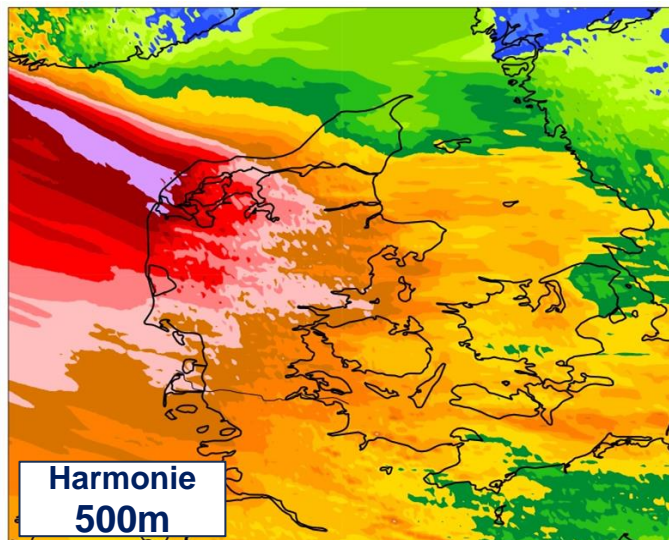

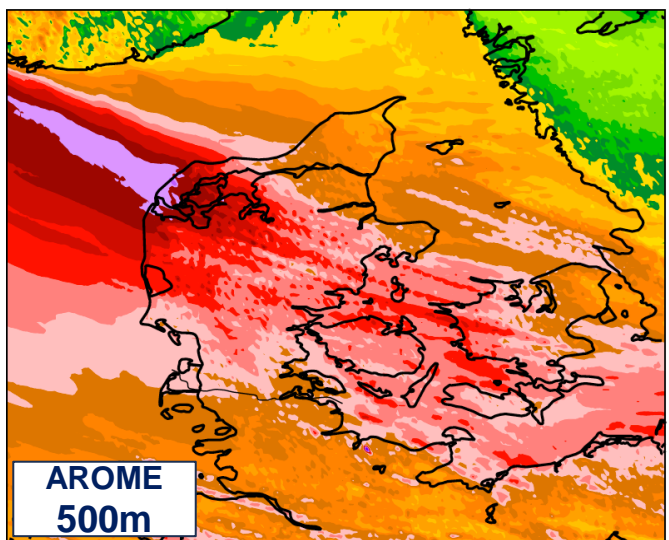

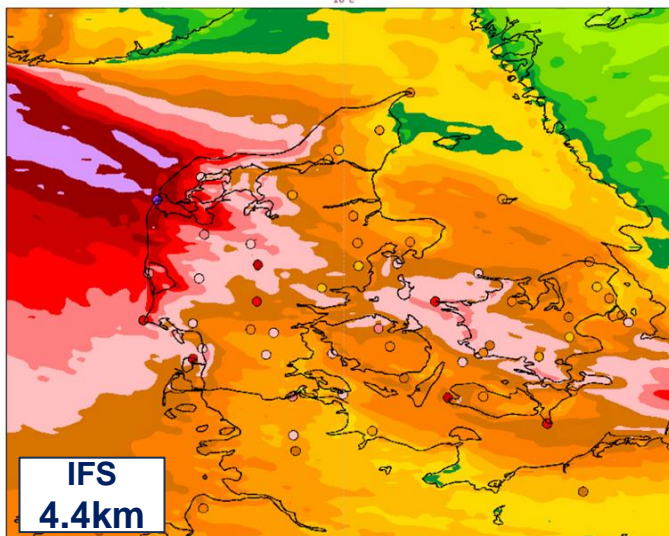

4. Added value Global DT and On-Demand DT for Extremes

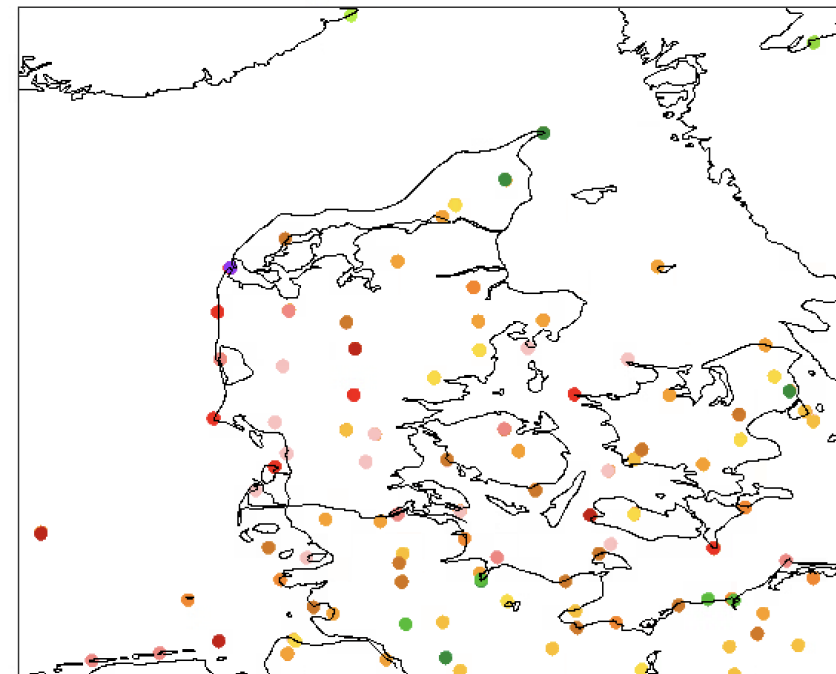

4. Added value Global DT and On-Demand DT for Extremes

m/s

Storm Pia

48h-max 10m-wind gust.

2023-12-20 00Z

VT 2023-12-22 00Z

4. Added value Global DT and On-Demand DT for Extremes

24h precipitation. Urban floods Valencia.
2022-05-01 00 UTC at T+72h

Localised extreme precipitation in Valencia city > 150 mm/24h

IFS 9 km

IFS 4.4 km

mm

Observations

4. Added value Global DT and On-Demand DT for Extremes

On-Demand DT (2.5km)

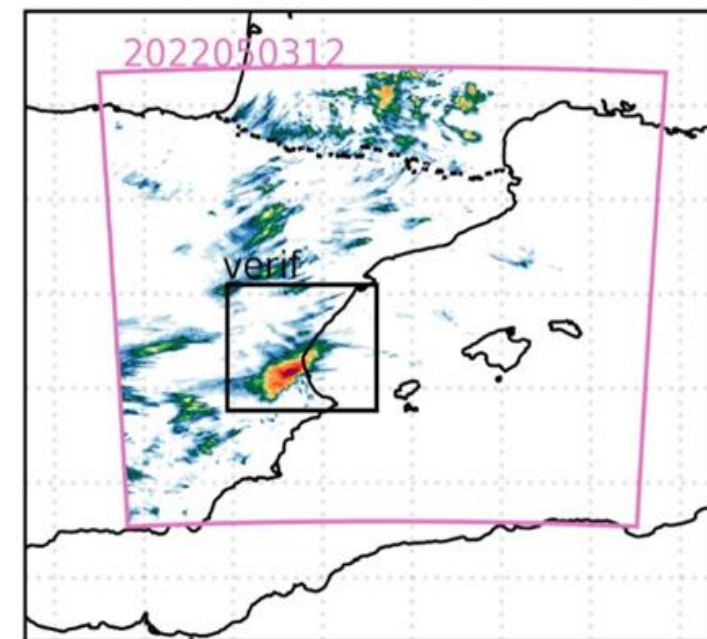

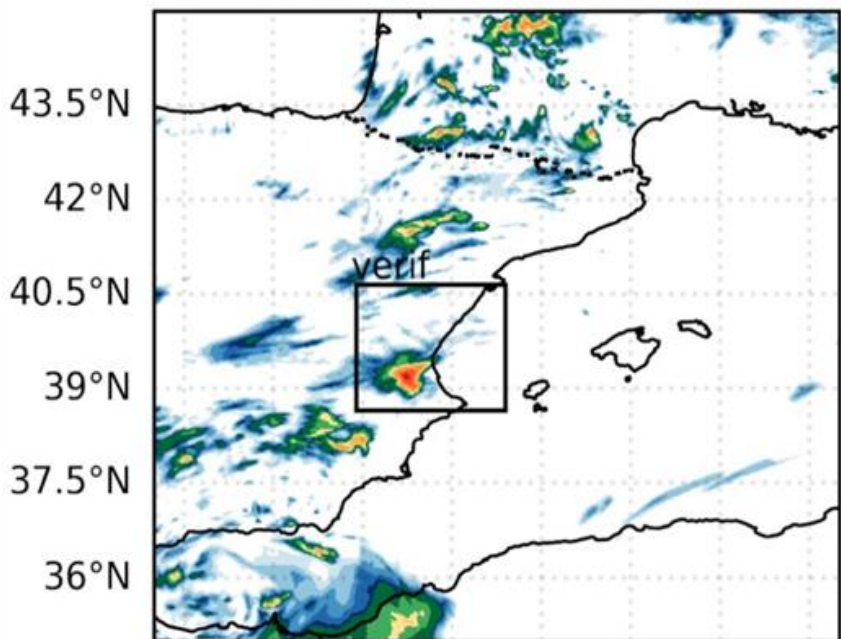

OPERA radar

On-Demand DT (500m)

Valid: 2022050312+06 up to +12 UTC

Valid: 2022050317-2022050323 UTC

Valid: 2022050312+06 up to +12 UTC

7-hour Accumulated Precipitation (mm)

Conclusions from success stories and beyond...

- **Clear added value** observed in certain **extremes** when increasing resolution from IFS 9 km to **4.4 km** for:
 - ◆ Intensification of Tropical cyclones/medicanes
 - ◆ Orographic precipitation, other surface variables in complex orographic areas
- **Less clear added value** was observed for surface variables and local convection in **flat areas** with the 4.4 km.
- ACCORD NWP sub-km added value: from **2.5 km to 500 m** resolution (Harmonie-Arome) shows added value in specific cases, but needs to be further explored. Benefits from IFS 4.4 km to ACCORD sub-km is observed in various (high impact) events but we continue evaluating common severe events to obtain more clear conclusions.
- The lack of an **ensemble** and specific **data assimilation** at sub-km scales may partly explain the absence of added value in certain cases. Efforts are ongoing to **quantify uncertainty** in Phase II through ensemble approaches.
